This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

25.2.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

Errors

None.

Example

```
MYSQL_FIELD *field;
while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

25.2.3.18. `mysql_fetch_field_direct()`

`MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)`

Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

Return Values

The `MYSQL_FIELD` structure for the specified column.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

25.2.3.19. `mysql_fetch_fields()`

`MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)`

Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

25.2.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

Example

```
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n",
               i, lengths[i]);
    }
}
```

25.2.3.21. `mysql_fetch_row()`

```
MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)
```

Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%s] ", (int) lengths[i],
                row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

25.2.3.22. [mysql_field_count\(\)](#)

`unsigned int mysql_field_count(MYSQL *mysql)`

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when [mysql_store_result\(\)](#) returned `NULL` (and thus you have no result set pointer). In this case, you can call [mysql_field_count\(\)](#) to determine whether [mysql_store_result\(\)](#) should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a [SELECT](#) (or [SELECT](#)-like) statement. The example shown here illustrates how this may be done.

See [Section 25.2.14.1, “Why mysql_store_result\(\) Sometimes Returns NULL After mysql_query\(\) Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if(mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

```
    }
    else // mysql_store_result() should have returned data
    {
        fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    }
}
```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

25.2.3.23. `mysql_field_seek()`

`MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)`

Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

25.2.3.24. `mysql_field_tell()`

`MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)`

Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

Return Values

The current offset of the field cursor.

Errors

None.

25.2.3.25. `mysql_free_result()`

`void mysql_free_result(MYSQL_RES *result)`

Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

25.2.3.26. `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

Description

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

Example

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

25.2.3.27. `mysql_get_client_info()`

```
const char *mysql_get_client_info(void)
```

Description

Returns a string that represents the client library version.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

25.2.3.28. `mysql_get_client_version()`

```
unsigned long mysql_get_client_version(void)
```

Description

Returns an integer that represents the client library version. The value has the format `XYZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

25.2.3.29. `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

Description

Returns a string describing the type of connection in use, including the server hostname.

Return Values

A character string representing the server hostname and the connection type.

Errors

None.

25.2.3.30. `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

25.2.3.31. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

Description

Returns a string that represents the server version number.

Return Values

A character string that represents the server version number.

Errors

None.

25.2.3.32. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

Description

Returns the version number of the server as an integer.

Return Values

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 5.1.5 is returned as 50105.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

Errors

None.

25.2.3.33. `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

Description

`mysql_get_ssl_cipher()` returns the SSL cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

This function was added in MySQL 5.1.9.

Return Values

A string naming the SSL cipher used for the connection, or `NULL` if no cipher is being used.

25.2.3.34. `mysql_hex_string()`

`unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)`

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value` format. However, the return value does not include the `0x` or `X'...`. The caller must supply whichever of those is desired.

Example

```
char query[1000], *end;

end = strmov(query, "INSERT INTO test_table values(");
end = strmov(end, "0x");
end += mysql_hex_string(end, "What's this", 11);
end = strmov(end, "0x");
end += mysql_hex_string(end, "binary data: \0\r\n", 16);
*end++ = ')';

if (mysql_real_query(&mysql, query, (unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
        mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

25.2.3.35. `mysql_info()`

`const char *mysql_info(MYSQL *mysql)`

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`

String format: `Records: 100 Duplicates: 0 Warnings: 0`

- `INSERT INTO ... VALUES (...),(...),(...)...`

String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `LOAD DATA INFILE ...`

String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`

- `ALTER TABLE`

String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `UPDATE`

String format: `Rows matched: 40 Changed: 40 Warnings: 0`

Note that `mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

Errors

None.

25.2.3.36. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, `NULL` is returned.

25.2.3.37. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit non-special value.
- In the case of a multiple-row `INSERT` statement, the return value of `mysql_insert_id()` depends on the MySQL server version.

In MySQL 5.1.12 and later, `mysql_insert_id()` returns the **first** automatically generated `AUTO_INCREMENT` value that was *success-*

fully inserted. In MySQL 5.1.11 and earlier, `mysql_insert_id()` returns the **first** automatically generated `AUTO_INCREMENT` value, regardless of whether the insertion of that value was successful.

If no rows are successfully inserted, then `mysql_insert_id()` returns 0.

- Starting in MySQL 5.1.12, if an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, then `mysql_insert_id()` returns the id of the last inserted row.
- Starting in MySQL 5.1.12, if an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, then `mysql_insert_id()` returns `expr`.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by updating any column to `LAST_INSERT_ID(expr)`.
- The value of `mysql_insert_id()` is not affected by statements such as `SELECT` that return a result set.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

For 5.1.12 and later, the return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an auto increment column, and an automatically generated value was successfully inserted, return the value of the first such value.
2. If there was a `LAST_INSERT_ID(EXPR)` in the statement, return `EXPR`, even if there was an auto increment column in the affected table.
3. The return value varies depending on the statement used. When called after an `INSERT INTO` statement:
 - If there is an auto increment column in the table, and there were some explicit values for this column that were successfully inserted into the table, then return the last of the explicit values.

When called after an `INSERT ... ON DUPLICATE KEY` statement:

- If there is an auto increment column in the table and there were some explicit successfully inserted values, or some updated rows, then return the last of the inserted or updated values.

Note

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

See [Section 11.11.3, “Information Functions”](#).

Also note that the value of the SQL `LAST_INSERT_ID()` function will contain the value of the first automatically generated value that was successfully inserted (starting from 5.1.12) or the first automatically generated value if any rows were successfully inserted (before 5.1.12). Another difference is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific non-special value.

The reason for the difference between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide a little more exact information of what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

None.

25.2.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Asks the server to kill the thread specified by `pid`.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

See [Section 25.2.2, “C API Function Overview”](#), and [Section 25.2.3.40, “`mysql\_library\_init\(\)`”](#), for usage information.

25.2.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

This function should be called to initialize the MySQL library before you call any other MySQL function. If your application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See [Section 25.2.3.39, “`mysql\_library\_end\(\)`”](#).

The `argc` and `argv` arguments are analogous to the arguments to `main()`. The first element of `argv` is ignored (it typically contains

the program name). For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. `mysql_library_init()` makes a copy of the arguments so it's safe to destroy `argv` or `groups` after the call.

If you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See [Section 4.3.2, “Using Option Files”](#). The final entry in the array should be `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

See [Section 25.2.2, “C API Function Overview”](#), for additional usage information.

Example

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program",          /* this string is not used */
    "--datadir=",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
    if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                          server_args, server_groups)) {
        fprintf(stderr, "could not initialize MySQL library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();

    return EXIT_SUCCESS;
}
```

Return Values

Zero if successful. Non-zero if an error occurred.

25.2.3.41. `mysql_list_dbs()`

`MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)`

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters ‘%’ or ‘_’, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW databases [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

25.2.3.42. [mysql_list_fields\(\)](#)

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the *wild* parameter. *wild* may contain the wildcard characters ‘%’ or ‘_’, or may be a `NULL` pointer to match all fields. Calling [mysql_list_fields\(\)](#) is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

Note that it's recommended that you use `SHOW COLUMNS FROM tbl_name` instead of [mysql_list_fields\(\)](#).

You must free the result set with [mysql_free_result\(\)](#).

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

25.2.3.43. [mysql_list_processes\(\)](#)

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with [mysql_free_result\(\)](#).

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

25.2.3.44. [mysql_list_tables\(\)](#)

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the [wild](#) parameter. [wild](#) may contain the wildcard characters ‘%’ or ‘_’, or may be a [NULL](#) pointer to match all tables. Calling [mysql_list_tables\(\)](#) is similar to executing the query `SHOW tables [LIKE wild]`.

You must free the result set with [mysql_free_result\(\)](#).

Return Values

A [MYSQL_RES](#) result set for success. [NULL](#) if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

25.2.3.45. [mysql_more_results\(\)](#)

```
my_bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute [CALL](#) statements, which can return multiple result sets.

[mysql_more_results\(\)](#) true if more results exist from the currently executed statement, in which case the application must call [mysql_next_result\(\)](#) to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#), and [Section 25.2.3.46, “mysql_next_result\(\)”](#).

Errors

None.

25.2.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

If more statement results exist, `mysql_next_result()` reads the next statement result and returns the status back to the application.

Before calling `mysql_next_result()`, you must call `mysql_free_result()` for the preceding statement if it is a query that returned a result set.

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If `mysql_next_result()` returns an error, no other statements are executed and there are no more results to fetch.

If your program executes stored procedures with the `CALL` SQL statement, you *must* set the `CLIENT_MULTI_RESULTS` flag explicitly, or implicitly by setting `CLIENT_MULTI_STATEMENTS` when you call `mysql_real_connect()`. This is because each `CALL` returns a result to indicate the call status, in addition to any results sets that might be returned by statements executed within the procedure. In addition, because `CALL` can return multiple results, you should process those results using a loop that calls `mysql_next_result()` to determine whether there are more results.

For an example that shows how to use `mysql_next_result()`, see [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order. For example if you didn't call `mysql_use_result()` for a previous result set.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

25.2.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL *` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 25.2.14.1, “Why `mysql\_store\_result\(\)` Sometimes Returns `NULL` After `mysql\_query\(\)` Returns Success](#)”.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

25.2.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

25.2.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, `arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysql` embedded server library and are unused for applications linked against the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)
Statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.
- `MYSQL_OPT_COMPRESS` (argument: not used)
Use the compressed client/server protocol.
- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)
Connect timeout in seconds.
- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)
For an application linked against the `libmysql` embedded server library, this allows the library to guess whether to use the embedded server or a remote server. “Guess” means that if the hostname is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)
If no pointer is given or if pointer points to an `unsigned int` that has a non-zero value, the `LOAD LOCAL INFILE` statement is enabled.
- `MYSQL_OPT_NAMED_PIPE` (argument: not used)
Use named pipes to connect to a MySQL server on Windows, if the server allows named-pipe connections.
- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)
Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

Timeout for reads from server (works only for TCP/IP connections, and only for Windows prior to MySQL 5.1.12). You can this option so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes.

- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly.

Note: `mysql_real_connect()` incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value before MySQL 5.1.6. Therefore, prior to that version, if you want reconnect to be enabled for each connection, you must call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option after each call to `mysql_real_connect()`. This is not necessary as of 5.1.6: Call `mysql_options()` only before `mysql_real_connect()` as usual.

- `MYSQL_OPT_SET_CLIENT_IP` (argument type: `char *`)

For an application linked against the `libmysql` embedded server library (when `libmysql` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

Enable or disable verification of the server's Common Name value in its certificate against the hostname used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. Added in MySQL 5.1.11.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

For an application linked against the `libmysql` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysql` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

Timeout for writes to server (works currently only on Windows on TCP/IP connections).

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements via `MYSQL_BIND.error`. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool*`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char*`)

The pathname to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char*`)

The name of the character set to use as the default character set.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char*`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connection. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

Note that the `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options:

Option	Description
<code>connect-timeout</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>compress</code>	Use the compressed client/server protocol.
<code>database</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host</code>	Default hostname.
<code>init-command</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See Section 25.2.3.52 , “ <code>mysql_real_connect()</code> ”.
<code>local-infile[=(0 1)]</code>	If no argument or argument <code>!= 0</code> then enable use of <code>LOAD DATA LOCAL</code> .
<code>max_allowed_packet</code>	Max size of packet client can read from server.
<code>multi-results</code>	Allow multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Allow the client to send multiple statements in a single string (separated by ‘;’).
<code>password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.
<code>protocol={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>port</code>	Default port number.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>na shared-memory-base-name=me</code>	Shared-memory name to use to connect to server (default is “MYSQL”).
<code>socket</code>	Default socket file.
<code>user</code>	Default user.

Note that `timeout` has been replaced by `connect-timeout`, but `timeout` is still supported in MySQL 5.1 for backward compatibility.

For more information about option files, see [Section 4.3.2](#), “Using Option Files”.

Before MySQL 5.1.18, the `arg` argument was declared as `char *`.

Return Values

Zero for success. Non-zero if you specify an unknown option.

Example

```
MYSQL mysql;
```

```
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_COMPRESS, 0);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "odbc");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
        mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

25.2.3.50. `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down, an attempt to reconnect is made unless auto-reconnect is disabled.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

Return Values

Zero if the connection to the server is alive. Non-zero if an error occurred. A non-zero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (`;`) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `'\0'` character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 25.2.3.22, “`mysql\_field\_count\(\)`”](#).

Return Values

Zero if the statement was successful. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

25.2.3.52. [mysql_real_connect\(\)](#)

`MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)`

Description

[mysql_real_connect\(\)](#) attempts to establish a connection to a MySQL database engine running on [host](#).

[mysql_real_connect\(\)](#) must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling [mysql_real_connect\(\)](#) you must call [mysql_init\(\)](#) to initialize the `MYSQL` structure. You can change a lot of connect options with the [mysql_options\(\)](#) call. See [Section 25.2.3.49, “mysql_options\(\)”](#).
- The value of [host](#) may be either a hostname or an IP address. If [host](#) is `NULL` or the string `"localhost"`, a connection to the local host is assumed: For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to [mysql_options\(\)](#). The type of connection must be supported by the server. For a [host](#) value of `."` on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The [user](#) parameter contains the user's MySQL login ID. If [user](#) is `NULL` or the empty string `""`, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current username must be specified explicitly. See the MySQL ODBC section of [Chapter 26, Connectors](#).
- The [passwd](#) parameter contains the password for [user](#). If [passwd](#) is `NULL`, only entries in the [user](#) table for the user that have a blank (empty) password field are checked for a match. This allows the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

Note

Do not attempt to encrypt the password before calling [mysql_real_connect\(\)](#); password encryption is handled automatically by the client API.

- The [user](#) and [passwd](#) parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling [mysql_options\(mysql, MYSQL_SET_CHARSET_NAME, "charset_name"\)](#) prior to connecting.
- [db](#) is the database name. If [db](#) is not `NULL`, the connection sets the default database to this value.

- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This is automatically set if <code>CLIENT_MULTI_STATEMENTS</code> is set. See the note following this table for more information about this flag.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string (separated by <code>;</code>). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
<code>CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	Unused.
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .

If your program uses the `CALL` SQL statement to execute stored procedures that produce result sets, you *must* set the `CLIENT_MULTI_RESULTS` flag, either explicitly, or implicitly by setting `CLIENT_MULTI_STATEMENTS` when you call `mysql_real_connect()`. This is because each such stored procedure produces multiple results: the result sets returned by statements executed within the procedure, as well as a result to indicate the call status.

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string (`""`).
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- `CR_CONN_HOST_ERROR`

Failed to connect to the MySQL server.

- `CR_CONNECTION_ERROR`

Failed to connect to the local MySQL server.

- `CR_IPSOCK_ERROR`

Failed to create an IP socket.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SOCKET_CREATE_ERROR`

Failed to create a Unix socket.

- `CR_UNKNOWN_HOST`

Failed to find the IP address for the hostname.

- `CR_VERSION_ERROR`

A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version. This can happen if you use a very old client library to connect to a new server that wasn't started with the `--old-protocol` option.

- `CR_NAMEDPIPEOPEN_ERROR`

Failed to create a named pipe on Windows.

- `CR_NAMEDPIPEWAIT_ERROR`

Failed to wait for a named pipe on Windows.

- `CR_NAMEDPIPESETSTATE_ERROR`

Failed to get a pipe handler on Windows.

- `CR_SERVER_LOST`

If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

Example

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "your_prog_name");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some non-standard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

25.2.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), `'\n'`, `'\r'`, `'\'`, `'\"'`, and Control-Z (see [Section 8.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

```
char query[1000], *end;
end = strmov(query, "INSERT INTO test_table values(");
*end++ = '\n';
end += mysql_real_escape_string(&mysql, end, "What's this", 11);
*end++ = '\n';
*end++ = '\n';
*end++ = '\n';
end += mysql_real_escape_string(&mysql, end, "binary data: \0\r\n", 16);
*end++ = '\n';
*end++ = ')';

if (mysql_real_query(&mysql, query, (unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
        mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

25.2.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (`;`) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `'\0'` character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 25.2.3.22, “`mysql\_field\_count\(\)`”](#).

Return Values

Zero if the statement was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.3.55. `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- `REFRESH_GRANT`
Refresh the grant tables, like `FLUSH PRIVILEGES`.
- `REFRESH_LOG`
Flush the logs, like `FLUSH LOGS`.
- `REFRESH_TABLES`
Flush the table cache, like `FLUSH TABLES`.
- `REFRESH_HOSTS`
Flush the host cache, like `FLUSH HOSTS`.

- [REFRESH_STATUS](#)
Reset status variables, like [FLUSH STATUS](#).
- [REFRESH_THREADS](#)
Flush the thread cache.
- [REFRESH_SLAVE](#)
On a slave replication server, reset the master server information and restart the slave, like [RESET SLAVE](#).
- [REFRESH_MASTER](#)
On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like [RESET MASTER](#).

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

25.2.3.56. [mysql_reload\(\)](#)

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. It is preferable to use [mysql_query\(\)](#) to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

25.2.3.57. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Non-zero if an error occurred.

Errors

None.

25.2.3.58. `mysql_row_seek()`

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

25.2.3.59. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

25.2.3.60. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

Return Values

Zero for success. Non-zero if an error occurred.

Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

25.2.3.62. `mysql_set_local_infile_default()`

```
void
mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the **LOAD LOCAL DATA INFILE** handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

The `mysql_set_local_infile_default()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

25.2.3.63. `mysql_set_local_infile_handler()`

```
void
mysql_set_local_infile_handler(MYSQL *mysql,
    int (*local_infile_init)(void **, const char *, void *),
    int (*local_infile_read)(void *, char *, unsigned int),
    void (*local_infile_end)(void *),
    int (*local_infile_error)(void *, char*, unsigned int),
    void *userdata);
```

Description

This function installs callbacks to be used during the execution of **LOAD DATA LOCAL INFILE** statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, non-zero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
    char *error_msg,
```

```
unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len-1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The filename specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

The `mysql_set_local_infile_handler()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

25.2.3.64. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values:

MYSQL_OPTION_MULTI_STATEMENTS_ON	Enable multiple-statement support.
MYSQL_OPTION_MULTI_STATEMENTS_OFF	Disable multiple-statement support.

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL SQL` statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to allow the use of `CALL`.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `ER_UNKNOWN_COM_ERROR`

The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

25.2.3.65. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

Description

Asks the database server to shut down. The connected user must have `SHUTDOWN` privileges. MySQL 5.1 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysql-client` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.2.7, “The Shutdown Process”](#).

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

25.2.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. `'00000'` means “no error”. The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See [Section 25.2.3.14](#), “`mysql_errno()`”, [Section 25.2.3.15](#), “`mysql_error()`”, and [Section 25.2.7.26](#), “`mysql_stmt_sqlstate()`”.

25.2.3.67. `mysql_ssl_set()`

```
int mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca, const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless OpenSSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the pathname to the key file.
- `cert` is the pathname to the certificate file.
- `ca` is the pathname to the certificate authority file.
- `capath` is the pathname to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

Return Values

This function always returns 0. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

25.2.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes up-time in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

25.2.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully retrieves data (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a non-zero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 25.2.9, “C API Handling of Multiple Statement Execution”](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 25.2.3.22, “mysql_field_count\(\)”](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a non-empty string, `mysql_errno()` returns non-zero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 25.2.14.1, “Why mysql_store_result\(\) Sometimes Returns NULL After mysql_query\(\) Returns Success”](#).

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

25.2.3.70. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Return Values

The thread ID of the current connection.

Errors

None.

25.2.3.71. `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

You must call `mysql_store_result()` or `mysql_use_result()` for every query that successfully retrieves data (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`).

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the un-fetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysql` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.3.72. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of warnings generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

25.2.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and non-prepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following statements can be used as prepared statements: `CREATE`, `TABLE`, `DELETE`, `DO`, `INSERT`, `REPLACE`, `SELECT`, `SET`, `UPDATE`, and most `SHOW` statements.

As of MySQL 5.1.10, the following additional statements are supported:

```
ANALYZE TABLE
OPTIMIZE TABLE
REPAIR TABLE
```

As of MySQL 5.1.12, the following additional statements are supported:

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
      | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

Other statements are not yet supported in MySQL 5.1.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using prepared statements in the Knowledge Base article, [How can I create server-side prepared statements?](https://www.mysql.com/knowledge-base/how-can-i-create-server-side-prepared-statements/). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.2.5. C API Prepared Statement Data types

Prepared statements use several data structures:

- To prepare a statement, pass the statement string to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail.

`MYSQL_STMT`

This structure represents a prepared statement. A statement is created by calling `mysql_stmt_init()`, which returns a statement handle (that is, a pointer to a `MYSQL_STMT`). The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

The `MYSQL_STMT` structure has no members that are intended for application use. Also, you should not try to make a copy of a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

- **MYSQL_BIND**

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, **MYSQL_BIND** is used with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, **MYSQL_BIND** is used with `mysql_stmt_bind_result()` to bind result set buffers for use in fetching rows with `mysql_stmt_fetch()`.

To use a **MYSQL_BIND** structure, you should zero its contents to initialize it, and then set its members appropriately. For example, to declare and initialize an array of three **MYSQL_BIND** structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The **MYSQL_BIND** structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- **enum enum_field_types buffer_type**

The type of the buffer. This member indicates the data type of the C language variable that you are binding to the statement parameter. The allowable **buffer_type** values are listed later in this section. For input, **buffer_type** indicates the type of the variable containing the value that you will send to the server. For output, it indicates the type of the variable into which you want a value received from the server to be stored.

- **void *buffer**

A pointer to the buffer to be used for data transfer. This is the address of a variable.

For input, **buffer** is a pointer to the variable in which a statement parameter's data value is stored. When you call `mysql_stmt_execute()`, MySQL takes the value that you have stored in the variable and uses it in place of the corresponding parameter marker in the statement.

For output, **buffer** is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL returns a column value and stores it in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use variables that have types similar to those of the corresponding SQL values. For numeric data types, **buffer** should point to a variable of the proper numeric C type. (For **char** or integer variables, you should also indicate whether the variable has the **unsigned** attribute by setting the **is_unsigned** member, described later in this list.) For character (non-binary) and binary string data types, **buffer** should point to a character buffer. For date and time data types, **buffer** should point to a **MYSQL_TIME** structure.

See the notes about type conversions later in the section.

- **unsigned long buffer_length**

The actual size of ***buffer** in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the **buffer_length** value specifies the length of ***buffer** when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- **unsigned long *length**

A pointer to an **unsigned long** variable that indicates the actual number of bytes of data stored in ***buffer**. **length** is used for character or binary C data.

For input parameter data binding, **length** points to an **unsigned long** variable that indicates the actual length of the parameter value stored in ***buffer**; this is used by `mysql_stmt_execute()`.

For output value binding, the return value of `mysql_stmt_fetch()` determines the interpretation of the length:

- If `mysql_stmt_fetch()` returns 0, ***length** indicates the actual length of the parameter value.

- If `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED`, `*length` indicates the non-truncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the length of the data value is determined by the `buffer_type` value.

If you need to be able to determine the length of a returned value before fetching it with `mysql_stmt_fetch()`, see [Section 25.2.7.11, “mysql_stmt_fetch\(\)”](#), for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

The reason that `is_null` is not a boolean scalar but is instead a *pointer* to a boolean scalar is to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other members do not matter.
- If your data values are always `NOT NULL`, set the other members appropriately for the variable you are binding, and set `is_null = (my_bool*) 0`.
- In all other cases, set the other members appropriately, and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether data values are `NULL` or `NOT NULL`, respectively.

For output, the value pointed to by `is_null` is set to true after you fetch a row if the result set column value returned from the statement is `NULL`.

- `my_bool is_unsigned`

This member is used for C variables with data types that can be `unsigned` (`char`, `short int`, `int`, `long long int`). Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. (Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.) When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`), and set the `buffer` member to point to a `MYSQL_TIME` structure.

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year

<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag to indicate whether the time is negative
<code>unsigned long second_part</code>	The fractional part of the second in microseconds; currently unused

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 25.2.10, “C API Handling of Date and Time Values”](#).

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for input values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion.

Input Variable C Type	<code>buffer_type</code> Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>
<code>char[]</code>	<code>MYSQL_TYPE_STRING</code> (for non-binary data)	<code>TEXT</code> , <code>CHAR</code> , <code>VARCHAR</code>
<code>char[]</code>	<code>MYSQL_TYPE_BLOB</code> (for binary data)	<code>BLOB</code> , <code>BINARY</code> , <code>VARBINARY</code>
	<code>MYSQL_TYPE_NULL</code>	<code>NULL</code>

The use of `MYSQL_TYPE_NULL` is described earlier in connection with the `is_null` member.

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for output values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the SQL types of received values, the corresponding type code that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion.

SQL Type of Received Value	<code>buffer_type</code> Value	Output Variable C Type
<code>TINYINT</code>	<code>MYSQL_TYPE_TINY</code>	<code>signed char</code>
<code>SMALLINT</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>MEDIUMINT</code>	<code>MYSQL_TYPE_INT24</code>	<code>int</code>
<code>INT</code>	<code>MYSQL_TYPE_LONG</code>	<code>int</code>
<code>BIGINT</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>long long int</code>
<code>FLOAT</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>float</code>
<code>DOUBLE</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>double</code>
<code>DECIMAL</code>	<code>MYSQL_TYPE_NEWDECIMAL</code>	<code>char[]</code>

YEAR	MYSQL_TYPE_SHORT	short int
TIME	MYSQL_TYPE_TIME	MYSQL_TIME
DATE	MYSQL_TYPE_DATE	MYSQL_TIME
DATETIME	MYSQL_TYPE_DATETIME	MYSQL_TIME
TIMESTAMP	MYSQL_TYPE_TIMESTAMP	MYSQL_TIME
CHAR, BINARY	MYSQL_TYPE_STRING	char []
VARCHAR, VARBINARY	MYSQL_TYPE_VAR_STRING	char []
TINYBLOB, TINYTEXT	MYSQL_TYPE_TINY_BLOB	char []
BLOB, TEXT	MYSQL_TYPE_BLOB	char []
MEDIUMBLOB, MEDIUMTEXT	MYSQL_TYPE_MEDIUM_BLOB	char []
LONGBLOB, LONGTEXT	MYSQL_TYPE_LONG_BLOB	char []
BIT	MYSQL_TYPE_BIT	char []

The C language variable types are those recommended if you want to avoid type conversions. If there is a mismatch between the C variable type on the client side and the corresponding SQL value on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value indicates the MySQL the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch a SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL will convert the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array will be a 4-byte string containing `'255\0'`.
- `DECIMAL` values are returned as strings, which is why the corresponding C type is `char[]`. `DECIMAL` values returned by the server correspond to the string representation of the original server-side value. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer (thus, the corresponding C type is `char[]` here, too). The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can use a query of the following form that uses `+ 0` to cause the value to be cast to integer:

```
SELECT bit_col + 0 FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 25.2.7.22](#), “`mysql_stmt_result_metadata()`”, and [Section 25.2.1](#), “C API Data types”.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. The size of the buffers should be chosen according to the types of the variables into which you fetch the values.

For input character (non-binary) string data (indicated by `MYSQL_TYPE_STRING`), the value is assumed to be in the character set indicated by the `character_set_client` system variable. If the value is stored into a column with a different character set, the appropriate conversion to that character set occurs. For input binary string data (indicated by `MYSQL_TYPE_BLOB`), the value is treated as having the `binary` character set; that is, it is treated as a byte string and no conversion occurs.

To determine whether output string values in a result set returned from the server contain binary or non-binary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 25.2.1, “C API Data types”](#)). If so, the character set is `binary`, which indicates binary rather than non-binary data. This enables you to distinguish between `BINARY` and `CHAR`, `VARBINARY` and `VARCHAR`, and the `BLOB` and `TEXT` types.

25.2.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 25.2.7, “C API Prepared Statement Function Descriptions”](#).

Function	Description
<code>mysql_stmt_affected_rows()</code>	Returns the number of rows changes, deleted, or inserted by prepared <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> statement.
<code>mysql_stmt_attr_get()</code>	Get value of an attribute for a prepared statement.
<code>mysql_stmt_attr_set()</code>	Sets an attribute for a prepared statement.
<code>mysql_stmt_bind_param()</code>	Associates application data buffers with the parameter markers in a prepared SQL statement.
<code>mysql_stmt_bind_result()</code>	Associates application data buffers with columns in the result set.
<code>mysql_stmt_close()</code>	Frees memory used by prepared statement.
<code>mysql_stmt_data_seek()</code>	Seeks to an arbitrary row number in a statement result set.
<code>mysql_stmt_errno()</code>	Returns the error number for the last statement execution.
<code>mysql_stmt_error()</code>	Returns the error message for the last statement execution.
<code>mysql_stmt_execute()</code>	Executes the prepared statement.
<code>mysql_stmt_fetch()</code>	Fetches the next row of data from the result set and returns data for all bound columns.
<code>mysql_stmt_fetch_column()</code>	Fetch data for one column of the current row of the result set.
<code>mysql_stmt_field_count()</code>	Returns the number of result columns for the most recent statement.
<code>mysql_stmt_free_result()</code>	Free the resources allocated to the statement handle.
<code>mysql_stmt_init()</code>	Allocates memory for <code>MYSQL_STMT</code> structure and initializes it.
<code>mysql_stmt_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by prepared statement.
<code>mysql_stmt_num_rows()</code>	Returns total rows from the statement buffered result set.
<code>mysql_stmt_param_count()</code>	Returns the number of parameters in a prepared SQL statement.
<code>mysql_stmt_param_metadata()</code>	(Return parameter metadata in the form of a result set.) Currently, this function does nothing.
<code>mysql_stmt_prepare()</code>	Prepares an SQL string for execution.
<code>mysql_stmt_reset()</code>	Reset the statement buffers in the server.
<code>mysql_stmt_result_metadata()</code>	Returns prepared statement metadata in the form of a result set.
<code>mysql_stmt_row_seek()</code>	Seeks to a row offset in a statement result set, using value returned from <code>mysql_stmt_row_tell()</code> .
<code>mysql_stmt_row_tell()</code>	Returns the statement row cursor position.
<code>mysql_stmt_send_long_data()</code>	Sends long data in chunks to server.
<code>mysql_stmt_sqlstate()</code>	Returns the SQLSTATE error code for the last statement execution.
<code>mysql_stmt_store_result()</code>	Retrieves the complete result set to the client.

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare` to prepare it, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through

`mysql_stmt_bind_param()`.

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

You can also send the text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 25.2.7.25](#), “`mysql_stmt_send_long_data()`”.

When statement execution has been completed, the statement handle must be closed using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement produces a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and total number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the packet row by row and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error code, error message, and SQLSTATE value using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes **Prepare** and **Execute** lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each **Prepare** and **Execute** line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each **Execute** line shows a prepared statement after substitution of data values for `?` parameters.

Version notes: **Prepare** lines are displayed without `[N]` before MySQL 4.1.10. **Execute** lines are not displayed at all before MySQL 4.1.10.

25.2.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

Note that all functions operating with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

25.2.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

Returns the total number of rows changed, deleted, or inserted by the last executed statement. May be called immediately after `mysql_stmt_execute()` for **UPDATE**, **DELETE**, or **INSERT** statements. For **SELECT** statements, `mysql_stmt_affected_rows()` works like `mysql_num_rows()`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an **UPDATE** statement, no rows matched the **WHERE** clause in the query, or that no query has yet been executed. -1 indicates that the query returned an error or that, for a **SELECT** query, `mysql_stmt_affected_rows()` was called prior to calling `mysql_stmt_store_result()`. Because `mysql_stmt_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

See [Section 25.2.3.1](#), “`mysql_affected_rows()`”, for additional information on the return value.

Errors

None.

Example

For the usage of `mysql_stmt_affected_rows()`, refer to the Example from [Section 25.2.7.10](#), “`mysql_stmt_execute()`”.

25.2.7.2. `mysql_stmt_attr_get()`

```
int mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, then `arg` should point to the value of the integer.

See [Section 25.2.7.3](#), “`mysql_stmt_attr_set()`”, for a list of options and option types.

Note

In MySQL 5.1, `mysql_stmt_attr_get()` originally used `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This was corrected in MySQL 5.1.7.

Return Values

Zero if successful. Non-zero if `option` is unknown.

Errors

None.

25.2.7.3. `mysql_stmt_attr_set()`

```
int mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, then `arg` should point to the value of the integer.

Possible `option` values:

Option	Argument Type	Function
<code>STMT_ATTR_UPDATE_MAX_LENGTH</code>	<code>my_bool *</code>	If set to 1: Update metadata <code>MYSQL_FIELD->max_length</code> in <code>mysql_stmt_store_result()</code> .
<code>STMT_ATTR_CURSOR_TYPE</code>	<code>unsigned long *</code>	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be <code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
<code>STMT_ATTR_PREFETCH_ROWS</code>	<code>unsigned long *</code>	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

Return Values

Zero if successful. Non-zero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                        (void*) &prefetch_rows);
/* ... check return value ... */
```

25.2.7.4. `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each ‘?’ parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

[Section 25.2.5, “C API Prepared Statement Data types”](#), describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero if the bind operation was successful. Non-zero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_param()`, refer to the Example from [Section 25.2.7.10](#), “`mysql_stmt_execute()`”.

25.2.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. [Section 25.2.5](#), “C API Prepared Statement Data types”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero if the bind operation was successful. Non-zero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_result()`, refer to the Example from [Section 25.2.7.11](#), “`mysql_stmt_fetch()`”.

25.2.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *)
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero if the statement was freed successfully. Non-zero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

For the usage of `mysql_stmt_close()`, refer to the Example from [Section 25.2.7.10](#), “`mysql_stmt_execute()`”.

25.2.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

25.2.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B](#), *Errors, Error Codes, and Common Problems*.

Return Values

An error code value. Zero if no error occurred.

Errors

None.

25.2.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string (“”) is returned if no error occurred. This means the following two tests are equivalent:

```
if (mysql_stmt_errno(stmt))
{
    // an error occurred
}
```

```
if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

25.2.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

If the statement is an `UPDATE`, `DELETE`, or `INSERT`, the total number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`. If this is a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 25.2.7.11, “mysql_stmt_fetch\(\)”](#).

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Return Values

Zero if execution was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle.

```

#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                col2 VARCHAR(40),\
                                col3 SMALLINT,\
                                col4 TIMESTAMP)"

#define INSERT_SAMPLE "INSERT INTO \
    test_table(col1,col2,col3) \
    VALUES(?,?,?)"

MYSQL_STMT      *stmt;
MYSQL_BIND      bind[3];

        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

Note

For complete examples on the use of prepared statement functions, refer to the file [tests/mysql_client_test.c](#). This file can be obtained from a MySQL source distribution or from the BitKeeper source repository.

25.2.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that creates a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains `TRUE` (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data_length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
<code>MYSQL_NO_DATA</code>	No more rows/data exists
<code>MYSQL_DATA_TRUNCATED</code>	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. (Reporting is enabled by default, but can be controlled with `mysql_options()`.) To determine which parameters were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` parameter structures.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

- [CR_UNSUPPORTED_PARAM_TYPE](#)

The buffer type is [MYSQL_TYPE_DATE](#), [MYSQL_TYPE_TIME](#), [MYSQL_TYPE_DATETIME](#), or [MYSQL_TYPE_TIMESTAMP](#), but the data type is not [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#).

- All other unsupported conversion errors are returned from [mysql_stmt_bind_result\(\)](#).

Example

The following example demonstrates how to fetch data from a table using [mysql_stmt_result_metadata\(\)](#), [mysql_stmt_bind_result\(\)](#), and [mysql_stmt_fetch\(\)](#). (This example expects to retrieve the two rows inserted by the example shown in [Section 25.2.7.10](#), “[mysql_stmt_execute\(\)](#)”.) The [mysql](#) variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or **BLOB** value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Then the maximal length of column values will be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`. This strategy requires that you pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()` or the `max_length` values will not be calculated.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```

real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, 0, bind, 0);
}

```

25.2.7.12. `mysql_stmt_fetch_column()`

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero if the value was fetched successfully. Non-zero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`

Invalid column number.

- `CR_NO_DATA`

The end of the result set has already been reached.

25.2.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

25.2.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero if the result set was freed successfully. Non-zero if an error occurred.

Errors

25.2.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

Return values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

25.2.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an [AUTO_INCREMENT](#) column by the prepared [INSERT](#) or [UPDATE](#) statement. Use this function after you have executed a prepared [INSERT](#) statement on a table which contains an [AUTO_INCREMENT](#) field.

See [Section 25.2.3.37](#), “[mysql_insert_id\(\)](#)”, for more information.

Return Values

Value for [AUTO_INCREMENT](#) column which was automatically generated or explicitly set during execution of prepared statement, or value generated by [LAST_INSERT_ID\(*expr*\)](#) function. Return value is undefined if statement does not set [AUTO_INCREMENT](#) value.

Errors

None.

25.2.7.17. [mysql_stmt_num_rows\(\)](#)

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of [mysql_stmt_num_rows\(\)](#) depends on whether you used [mysql_stmt_store_result\(\)](#) to buffer the entire result set in the statement handle.

If you use [mysql_stmt_store_result\(\)](#), [mysql_stmt_num_rows\(\)](#) may be called immediately.

[mysql_stmt_num_rows\(\)](#) is intended for use with statements that return a result set, such as [SELECT](#). For statements such as [INSERT](#), [UPDATE](#), or [DELETE](#), the number of affected rows can be obtained with [mysql_stmt_affected_rows\(\)](#).

Return Values

The number of rows in the result set.

Errors

None.

25.2.7.18. [mysql_stmt_param_count\(\)](#)

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

For the usage of [mysql_stmt_param_count\(\)](#), refer to the Example from [Section 25.2.7.10](#), “[mysql_stmt_execute\(\)](#)”.

25.2.7.19. [mysql_stmt_param_metadata\(\)](#)

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

Description**Return Values****Errors****25.2.7.20. `mysql_stmt_prepare()`**

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

Description

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (`;`) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (`'?`') characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not allowed for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Return Values

Zero if the statement was prepared successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns non-zero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

For the usage of `mysql_stmt_prepare()`, refer to the Example from [Section 25.2.7.10, “`mysql\_stmt\_execute\(\)`”](#).

25.2.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Reset the prepared statement on the client and server to state after prepare. This is mainly used to reset data sent with `mysql_stmt_send_long_data()`. Any open cursor for the statement is closed.

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero if the statement was reset successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

25.2.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as total number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_result_metadata()`, refer to the Example from [Section 25.2.7.11](#), “`mysql_stmt_fetch()`”.

25.2.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

25.2.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

25.2.7.25. `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)
```

Description

Allows an application to send parameter data to the server in pieces (or “chunks”). Call this function after

`mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the **TEXT** or **BLOB** data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 25.2.7.21](#), “`mysql_stmt_reset()`”.

Return Values

Zero if the data is sent successfully to server. Non-zero if an error occurred.

Errors

- **CR_INVALID_BUFFER_USE**
The parameter does not have a string or binary type.
- **CR_COMMANDS_OUT_OF_SYNC**
Commands were executed in an improper order.
- **CR_SERVER_GONE_ERROR**
The MySQL server has gone away.
- **CR_OUT_OF_MEMORY**
Out of memory.
- **CR_UNKNOWN_ERROR**
An unknown error occurred.

Example

The following example demonstrates how to send the data for a **TEXT** column in chunks. It inserts the data value 'MySQL - The most popular Open Source database' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
    test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long          length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
```

```

fprintf(stderr, "\n param bind failed");
fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
fprintf(stderr, "\n send_long_data failed");
fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
    " - The most popular Open Source database",40))
{
fprintf(stderr, "\n send_long_data failed");
fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
fprintf(stderr, "\n mysql_stmt_execute failed");
fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
exit(0);
}

```

25.2.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

Return Values

A null-terminated character string containing the SQLSTATE error code.

25.2.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by executing prepared statements for SQL statements such as [SELECT](#), [SHOW](#), [DESCRIBE](#), and [EXPLAIN](#). By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 25.2.7.11, "mysql_stmt_fetch\(\)"](#).)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing a SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 25.2.7.22, "mysql_stmt_result_metadata\(\)"](#).

Note

MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications doesn't need `max_length`. If you want `max_length` to be updated, you can call

`mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 25.2.7.3](#), “`mysql_stmt_attr_set()`”.

Return Values

Zero if the results are buffered successfully. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_OUT_OF_MEMORY](#)
Out of memory.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

25.2.8. C API Prepared statement problems

Here follows a list of the currently known problems with prepared statements:

- [TIME](#), [TIMESTAMP](#), and [DATETIME](#) do not support parts of seconds (for example from [DATE_FORMAT\(\)](#)).
- When converting an integer to string, [ZEROFILL](#) is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with [MIN\(*number-with-zerofill*\)](#)).
- When converting a floating point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Before MySQL 5.1.17, prepared statements do not use the query cache. As of 5.1.17, prepared statements use the query cache under the conditions described in [Section 6.5.4.1](#), “[How the Query Cache Operates](#)”.
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by ‘;’ characters). This also means that prepared statements cannot invoke stored procedures that return result sets, because prepared statements do not support multiple result sets.

25.2.9. C API Handling of Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for [SELECT](#)) or an affected-rows count (as for [INSERT](#), [UPDATE](#), and so forth).

MySQL 5.1 also supports the execution of a string containing multiple statements separated by semicolon (;) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. Generally, these functions are used at the end of a loop that

iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures: A stored procedure returns a status result when it terminates, but it may also produce result sets as it runs (for example, if it executes `SELECT` statements). For any stored procedure that produces result sets in addition to the final status, you must be prepared to retrieve multiple results.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See [Section 25.2.4, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
 - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`.
 - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to allow processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following.

```
/* connect to server with option CLIENT_MULTI_STATEMENTS */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;\n
    CREATE TABLE test_table(id INT);\n
    INSERT INTO test_table VALUES(10);\n
    UPDATE test_table SET id=20 WHERE id=10;\n
    SELECT * FROM test_table;\n
    DROP TABLE test_table");

if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}
```

```

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
} while ((status = mysql_next_result(mysql)) > 0);
printf("Could not execute statement\n");
mysql_close(mysql);

```

The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns non-zero. The code as written distinguishes between no more results and an error, which allows a message to be printed for the latter occurrence.

25.2.10. C API Handling of Date and Time Values

The binary (prepared statement) protocol allows you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in [Section 25.2.5, “C API Prepared Statement Data types”](#).

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling `mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.
2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.
3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_bind_results()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
            timestamp_field) VALUES(?,?,?)");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
}

```

```

    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

25.2.11. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See [Section 25.2.16, “How to Make a Threaded Client”](#).

25.2.11.1. `my_init()`

```
void my_init(void)
```

Description

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access `my_init()`, your program must include the `my_sys.h` header file:

```
#include <my_sys.h>
```

Return Values

None.

25.2.11.2. `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

Return Values

Zero if successful. Non-zero if an error occurred.

25.2.11.3. `mysql_thread_end()`

```
void mysql_thread_end(void)
```

Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

Note that this `mysql_thread_end()` is *not invoked automatically by the client library*. It must be called explicitly to avoid a memory leak.

Return Values

None.

25.2.11.4. `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

25.2.12. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 25.1, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-libmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 25.2.2, “C API Function Overview”](#).

25.2.12.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 25.2.3.40, “mysql_library_init\(\)”](#).

Return Values

Zero if successful. Non-zero if an error occurred.

25.2.12.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See [Section 25.2.3.39, “mysql_library_end\(\)”](#).

Return Values

None.

25.2.13. Controlling Automatic Reconnect Behavior

The MySQL client library can perform an automatic reconnect to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

In MySQL 5.1, auto-reconnect is disabled by default.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.
- `mysql_ping()` does not attempt a reconnection if the connection is down. It returns an error instead.

25.2.14. Common Questions and Problems When Using the C API

MySQL Enterprise

Subscribers to MySQL Enterprise will find articles about the C API in the MySQL Knowledge Base. Access to the Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.2.14.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a non-empty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a non-zero value, the statement should have produced a non-empty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

25.2.14.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See Section 25.2.3.37, “`mysql_insert_id()`”.
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

25.2.14.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a non-magic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text');           # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see ??? [694].
- For information on `mysql_insert_id()`, the function you use from within the C API, see Section 25.2.3.37, “`mysql_insert_id()`”.
- For information on obtaining the auto incremented value when using Connector/J see Section 26.4.5, “Connector/J Notes and Tips”.
- For information on obtaining the auto incremented value when using Connector/ODBC see Section 26.1.6.1.1, “Obtaining Auto-Increment Values”.

25.2.14.4. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
    -lmysqlclient -lsocket -lnsl

Undefined      first referenced
symbol         in file
floor          /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

25.2.15. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-I/usr/local/mysql/include`), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See Section 25.9.2, “`mysql_config` — Get Compile Options for Compiling Clients”.

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o progname `"$CFG" --cflags` progname.c `"$CFG" --libs`"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

MySQL Enterprise

Subscribers to MySQL Enterprise will find an example client program in the Knowledge Base article, [Sample C program using the embedded MySQL server library](http://www.mysql.com/products/enterprise/advisors.html). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.2.16. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

In the older binaries that we distribute on our Web site (<http://www.mysql.com/>), client libraries other than those for Windows are not

normally compiled with the thread-safe option. Newer binary distributions should have both a normal and a thread-safe client library.

To get a threaded client where you can interrupt the client from other threads and set timeouts when talking with the MySQL server, you should use the `net_serv.o` code that the server uses and the `-lmysys`, `-lmystrings`, and `-ldbug` libraries.

If you don't need interrupts or timeouts, you can just compile a thread-safe client library (`mysqlclient_r`) and use this. See [Section 25.2, “MySQL C API”](#). In this case, you don't have to worry about the `net_serv.o` object file or the other MySQL libraries.

When using a threaded client and you want to use timeouts and interrupts, you can make great use of the routines in the `thr_alarm.c` file. If you are using routines from the `mysys` library, the only thing you must remember is to call `my_init()` first! See [Section 25.2.11, “C API Threaded Function Descriptions”](#).

In all cases, be sure to initialize the client library by calling `mysql_library_init()` before calling any other MySQL functions. When you are done with the library, call `mysql_library_end()`.

`mysql_real_connect()` is not thread-safe by default. The following notes describe how to compile a thread-safe client library and use it in a thread-safe manner. (The notes below for `mysql_real_connect()` also apply to `mysql_connect()` as well, although `mysql_connect()` is deprecated.)

To make `mysql_real_connect()` thread-safe, you must configure your MySQL distribution with this command:

```
shell> ./configure --enable-thread-safe-client
```

Then recompile the distribution to create a thread-safe client library, `libmysqlclient_r`. (Assuming that your operating system has a thread-safe `gethostbyname_r()` function.) This library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that is calling MySQL functions which did not create the connection to the MySQL database:

When you call `mysql_init()` or `mysql_connect()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things).

If you call a MySQL function, before the thread has called `mysql_init()` or `mysql_connect()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later.

To get things to work smoothly you have to do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.
2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()` or `mysql_connect()`, they will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

If “undefined symbol” errors occur when linking your client with `libmysqlclient_r`, in most cases this is because you haven't in-

cluded the thread libraries on the link/compile command.

25.3. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- **mysql**: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 5.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 5.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see [Section B.1.2.3, “Client does not support authentication protocol”](#)). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- **mysqli** - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.1, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the **mysqli** extension at <http://php.net/mysqli>. A helpful article can be found at <http://www.zend.com/php5/articles/php5-mysqli.php>.

If you're experiencing problems with enabling both the **mysql** and the **mysqli** extension when building PHP on Linux yourself, see [Section 25.3.2, “Enabling Both mysql and mysqli in PHP”](#).

The PHP distribution and documentation are available from the [PHP Web site](#). MySQL provides the **mysql** and **mysqli** extensions for the Windows operating system on <http://dev.mysql.com/downloads/connector/php/>. You can find information why you should preferably use the extensions provided by MySQL on that page.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and PHP in the Knowledge Base articles found at [PHP](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.3.1. Common Problems with MySQL and PHP

- **Error: Maximum Execution Time Exceeded**: This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- **Fatal error: Call to unsupported or undefined function mysql_connect() in ...**: This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress'**: This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol**: This is most often encountered when trying to use the older **mysql** extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer **mysqli** extension; or configure the MySQL server with `--old-passwords`. (See [Section B.1.2.3, “Client does not support authentication protocol”](#), for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysql2i>.

25.3.2. Enabling Both **mysql** and **mysqli** in PHP

If you're experiencing problems with enabling both the **mysql** and the **mysqli** extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysql=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm  
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2
```

3. Build and install PHP:

```
make  
make install
```

MySQL Enterprise

MySQL Enterprise subscribers will find more information about the `mysql` extension in the Knowledge Base articles found at [mysql](http://mysql.com). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.4. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl DBI support are given in [Section 2.15, “Perl Installation Notes”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI  
shell> perldoc DBI::FAQ  
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, <http://dbi.perl.org/>. That site hosts a general DBI mailing list. MySQL AB hosts a list specifically about `DBD::mysql`; see [Section 1.7.1, “MySQL Mailing Lists”](#).
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

25.5. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at <http://tangentsoft.net/mysql++/doc>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base. articles found at [C++](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.6. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at [Python](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

25.7. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

25.8. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

25.9. MySQL Program Development Utilities

This section describes some utilities that you may find useful when developing MySQL programs.

- `msql2mysql`

A shell script that converts `mSQL` programs to MySQL. It doesn't handle every case, but it gives a good start when converting.

- `mysql_config`

A shell script that produces the option values needed when compiling MySQL programs.

25.9.1. `msql2mysql` — Convert mSQL Programs for Use with MySQL

Initially, the MySQL C API was developed to be very similar to that for the mSQL database system. Because of this, mSQL programs often can be converted relatively easily for use with MySQL by changing the names of the C API functions.

The `msql2mysql` utility performs the conversion of mSQL C API function calls to their MySQL equivalents. `msql2mysql` converts the input file in place, so make a copy of the original before converting it. For example, use `msql2mysql` like this:

```
shell> cp client-prog.c client-prog.c.orig
shell> msql2mysql client-prog.c
client-prog.c converted
```

Then examine `client-prog.c` and make any post-conversion revisions that may be necessary.

`msql2mysql` uses the `replace` utility to make the function name substitutions. See [Section 7.26, “replace — A String-Replacement Utility”](#).

25.9.2. `mysql_config` — Get Compile Options for Compiling Clients

`mysql_config` provides you with useful information for compiling your MySQL client and connecting it to MySQL.

`mysql_config` supports the following options:

- `--cflags`

Compiler flags to find include files and critical compiler flags and defines used when compiling the `libmysqlclient` library.

- `--include`

Compiler options to find MySQL include files. (Note that normally you would use `--cflags` instead of this option.)

- `--libmysqld-libs, --embedded`

Libraries and options required to link with the MySQL embedded server.

- `--libs`

Libraries and options required to link with the MySQL client library.

- `--libs_r`

Libraries and options required to link with the thread-safe MySQL client library.

- `--port`

The default TCP/IP port number, defined when configuring MySQL.

- `--socket`

The default Unix socket file, defined when configuring MySQL.

- `--version`

Version number for the MySQL distribution.

If you invoke `mysql_config` with no options, it displays a list of all options that it supports, and their values:

```
shell> mysql_config
Usage: /usr/local/mysql/bin/mysql_config [options]
Options:
--cflags      [-I/usr/local/mysql/include/mysql -mcpu=pentiumpro]
--include     [-I/usr/local/mysql/include/mysql]
--libs        [-L/usr/local/mysql/lib/mysql -lmysqlclient -lz
              -lcrypt -lnsl -lm -L/usr/lib -lssl -lcrypto]
--libs_r      [-L/usr/local/mysql/lib/mysql -lmysqlclient_r
              -lpthread -lz -lcrypt -lnsl -lm -lpthread]
--socket      [/tmp/mysql.sock]
--port        [3306]
--version     [4.0.16]
--libmysqld-libs [-L/usr/local/mysql/lib/mysql -lmysqld -lpthread -lz
                 -lcrypt -lnsl -lm -lpthread -lrt]
```

You can use `mysql_config` within a command line to include the value that it displays for a particular option. For example, to compile a MySQL client program, use `mysql_config` as follows:

```
shell> CFG=/usr/local/mysql/bin/mysql_config
shell> sh -c "gcc -o progname ` $CFG --cflags ` progname.c ` $CFG --libs `"
```

When you use `mysql_config` this way, be sure to invoke it within backtick (``) characters. That tells the shell to execute it and substitute its output into the surrounding command.

Chapter 26. Connectors

This chapter describes MySQL Connectors, drivers that provide connectivity to the MySQL server for client programs. There are currently five MySQL Connectors:

- Connector/ODBC provides driver support for connecting to a MySQL server using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix and Mac OS X platforms.
- Connector/NET enables developers to create .NET applications that use data stored in a MySQL database. Connector/NET implements a fully-functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that want to use Connector/NET can be written in any of the supported .NET languages.
- The MySQL Visual Studio Plugin works with Connector/NET and Visual Studio 2005. The plugin is a MySQL DDEX Provider, which means that you can use the schema and data manipulation tools within Visual Studio to create and edit objects within a MySQL database.
- Connector/J provides driver support for connecting to MySQL from a Java application using the standard Java Database Connectivity (JDBC) API.
- Connector/MXJ is a tool that enables easy deployment and management of MySQL server and database through your Java application.
- Connector/PHP is a Windows-only connector for PHP that provides the `mysql` and `mysqli` extensions for use with MySQL 5.0.18 and later.

For information on connecting to a MySQL server using other languages and interfaces than those detailed above, including Perl, Python and PHP for other platforms and environments, please refer to the [Chapter 25, APIs and Libraries](#) chapter.

26.1. MySQL Connector/ODBC

The MySQL Connector/ODBC is the name for the family of MySQL ODBC drivers (previously called MyODBC drivers) that provide access to a MySQL database using the industry standard Open Database Connectivity (ODBC) API. This reference covers Connector/ODBC 3.51, a version of the API that provides ODBC 3.5x compliant access to a MySQL database.

The manual for versions of Connector/ODBC older than 3.51 can be located in the corresponding binary or source distribution.

For more information on the ODBC API standard and how to use it, refer to <http://www.microsoft.com/data/>.

The application development part of this reference assumes a good working knowledge of C, general DBMS knowledge, and finally, but not least, familiarity with MySQL. For more information about MySQL functionality and its syntax, refer to <http://dev.mysql.com/doc/>.

Typically, you need to install Connector/ODBC only on Windows machines. For Unix and Mac OS X you can use the native MySQL network or named pipe to communicate with your MySQL database. You may need Connector/ODBC for Unix or Mac OS X if you have an application that requires an ODBC interface to communicate with the database. Applications that require ODBC to communicate with MySQL include ColdFusion, Microsoft Office, and Filemaker Pro.

If you want to install the Connector/ODBC connector on a Unix host, then you must also install an ODBC manager.

Key topics:

- For help installing Connector/ODBC see [Section 26.1.2, “Connector/ODBC Installation”](#).
- For more information on connecting to a MySQL database from a Windows host using Connector/ODBC see [Section 26.1.4.2, “Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC”](#).
- If you want to use Microsoft Access as an interface to a MySQL database using Connector/ODBC see [Section 26.1.4.4, “Using Connector/ODBC with Microsoft Access”](#).
- General tips on using Connector/ODBC, including obtaining the last auto increment ID see [Section 26.1.6.1, “Connector/ODBC General Functionality”](#).

- For tips and common questions on using Connector/ODBC with specific application see [Section 26.1.6.2, “Connector/ODBC Application Specific Tips”](#).
- For a general list of Frequently Asked Questions see [Section 26.1.6.3, “Connector/ODBC Errors and Resolutions \(FAQ\)”](#).
- Additional support when using Connector/ODBC is available, see [Section 26.1.7, “Connector/ODBC Support”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and ODBC in the Knowledge Base articles about [ODBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

26.1.1. Introduction to Connector/ODBC

ODBC (Open Database Connectivity) provides a way for client programs to access a wide range of databases or data sources. ODBC is a standardized API that allows connections to SQL database servers. It was developed according to the specifications of the SQL Access Group and defines a set of function calls, error codes, and data types that can be used to develop database-independent applications. ODBC usually is used when database independence or simultaneous access to different data sources is required.

For more information about ODBC, refer to <http://www.microsoft.com/data/>.

26.1.1.1. Connector/ODBC Versions

There are currently two version of Connector/ODBC available:

- Connector/ODBC 5.0, currently in beta status, has been designed to extend the functionality of the Connector/ODBC 3.51 driver and incorporate full support for the functionality in the MySQL 5.0 server release, including stored procedures and views. Applications using Connector/ODBC 3.51 will be compatible with Connector/ODBC 5.0, while being able to take advantage of the new features. Features and functionality of the Connector/ODBC 5.0 driver are not currently included in this guide.
- Connector/ODBC 3.51 is the current release of the 32-bit ODBC driver, also known as the MySQL ODBC 3.51 driver. This version is enhanced compared to the older Connector/ODBC 2.50 driver. It has support for ODBC 3.5x specification level 1 (complete core API + level 2 features) in order to continue to provide all functionality of ODBC for accessing MySQL.
- MyODBC 2.50 is the previous version of the 32-bit ODBC driver from MySQL AB that is based on ODBC 2.50 specification level 0 (with level 1 and 2 features). Information about the MyODBC 2.50 driver is included in this guide for the purposes of comparison only.

Note

From this section onward, the primary focus of this guide is the Connector/ODBC 3.51 driver. More information about the MyODBC 2.50 driver in the documentation included in the installation packages for that version. If there is a specific issue (error or known problem) that only affects the 2.50 version, it may be included here for reference.

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

26.1.1.2. General Information About ODBC and Connector/ODBC

Open Database Connectivity (ODBC) is a widely accepted application-programming interface (API) for database access. It is based on the Call-Level Interface (CLI) specifications from X/Open and ISO/IEC for database APIs and uses Structured Query Language (SQL) as its database access language.

A survey of ODBC functions supported by Connector/ODBC is given at [Section 26.1.5.1, “Connector/ODBC API Reference”](#). For general information about ODBC, see <http://www.microsoft.com/data/>.

26.1.1.2.1. Connector/ODBC Architecture

The Connector/ODBC architecture is based on five components, as shown in the following diagram:

- **Application:**

The Application uses the ODBC API to access the data from the MySQL server. The ODBC API in turn uses the communicates with the Driver Manager. The Application communicates with the Driver Manager using the standard ODBC calls. The Application does not care where the data is stored, how it is stored, or even how the system is configured to access the data. It needs to know only the Data Source Name (DSN).

A number of tasks are common to all applications, no matter how they use ODBC. These tasks are:

- Selecting the MySQL server and connecting to it
- Submitting SQL statements for execution
- Retrieving results (if any)

- Processing errors
- Committing or rolling back the transaction enclosing the SQL statement
- Disconnecting from the MySQL server

Because most data access work is done with SQL, the primary tasks for applications that use ODBC are submitting SQL statements and retrieving any results generated by those statements.

- **Driver manager:**

The Driver Manager is a library that manages communication between application and driver or drivers. It performs the following tasks:

- Resolves Data Source Names (DSN). The DSN is a configuration string that identifies a given database driver, database, database host and optionally authentication information that enables an ODBC application to connect to a database using a standardized reference.

Because the database connectivity information is identified by the DSN, any ODBC compliant application can connect to the data source using the same DSN reference. This eliminates the need to separately configure each application that needs access to a given database; instead you instruct the application to use a pre-configured DSN.

- Loading and unloading of the driver required to access a specific database as defined within the DSN. For example, if you have configured a DSN that connects to a MySQL database then the driver manager will load the Connector/ODBC driver to enable the ODBC API to communicate with the MySQL host.
- Processes ODBC function calls or passes them to the driver for processing.

- **Connector/ODBC Driver:**

The Connector/ODBC driver is a library that implements the functions supported by the ODBC API. It processes ODBC function calls, submits SQL requests to MySQL server, and returns results back to the application. If necessary, the driver modifies an application's request so that the request conforms to syntax supported by MySQL.

- **DSN Configuration:**

The ODBC configuration file stores the driver and database information required to connect to the server. It is used by the Driver Manager to determine which driver to be loaded according to the definition in the DSN. The driver uses this to read connection parameters based on the DSN specified. For more information, [Section 26.1.3, “Connector/ODBC Configuration”](#).

- **MySQL Server:**

The MySQL database where the information is stored. The database is used as the source of the data (during queries) and the destination for data (during inserts and updates).

26.1.1.2.2. ODBC Driver Managers

An ODBC Driver Manager is a library that manages communication between the ODBC-aware application and any drivers. Its main functionality includes:

- Resolving Data Source Names (DSN).
- Driver loading and unloading.
- Processing ODBC function calls or passing them to the driver.

Both Windows and Mac OS X include ODBC driver managers with the operating system. Most ODBC Driver Manager implementations also include an administration application that makes the configuration of DSN and drivers easier. Examples and information on these managers, including Unix ODBC driver managers are listed below:

- Microsoft Windows ODBC Driver Manager ([odbc32.dll](#)), <http://www.microsoft.com/data/>.

- Mac OS X includes [ODBC Administrator](#), a GUI application that provides a simpler configuration mechanism for the Unix iODBC Driver Manager. You can configure DSN and driver information either through ODBC Administrator or through the iODBC configuration files. This also means that you can test ODBC Administrator configurations using the `iodbctest` command. <http://www.apple.com>.
- [unixODBC](#) Driver Manager for Unix ([libodbc.so](#)). See <http://www.unixodbc.org>, for more information. The [unixODBC](#) Driver Manager includes the Connector/ODBC driver 3.51 in the installation package, starting with version [unixODBC 2.1.2](#).
- [iODBC](#) ODBC Driver Manager for Unix ([libiodbc.so](#)), see <http://www.iodbc.org>, for more information.

26.1.2. Connector/ODBC Installation

You can install the Connector/ODBC drivers using two different methods, a binary installation and a source installation. The binary installation is the easiest and most straightforward method of installation. Using the source installation methods should only be necessary on platforms where a binary installation package is not available, or in situations where you want to customize or modify the installation process or Connector/ODBC drivers before installation.

Where to Get Connector/ODBC

MySQL AB distributes all its products under the General Public License (GPL). You can get a copy of the latest version of Connector/ODBC binaries and sources from the MySQL AB Web site <http://dev.mysql.com/downloads/>.

For more information about Connector/ODBC, visit <http://www.mysql.com/products/myodbc/>.

For more information about licensing, visit <http://www.mysql.com/company/legal/licensing/>.

Supported Platforms

Connector/ODBC can be used on all major platforms supported by MySQL. You can install it on:

- Windows 95, 98, Me, NT, 2000, XP, and 2003
- All Unix-like Operating Systems, including: AIX, Amiga, BSDI, DEC, FreeBSD, HP-UX 10/11, Linux, NetBSD, OpenBSD, OS/2, SGI Irix, Solaris, SunOS, SCO OpenServer, SCO UnixWare, Tru64 Unix
- Mac OS X and Mac OS X Server

Using a binary distribution offers the most straightforward method for installing Connector/ODBC. If you want more control over the driver, the installation location and or to customize elements of the driver you will need to build and install from the source.

If a binary distribution is not available for a particular platform build the driver from the original source code. You can contribute the binaries you create to MySQL by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com), so that it becomes available for other users.

For further instructions:

Platform	Binary	Source
Windows	Installation Instructions	Build Instructions
Unix/Linux	Installation Instructions	Build Instructions
Mac OS X	Installation Instructions	

26.1.2.1. Installing Connector/ODBC from a Binary Distribution on Windows

Before installing the Connector/ODBC drivers on Windows you should ensure that your Microsoft Data Access Components (MDAC) are up to date. You can obtain the latest version from the [Microsoft Data Access and Storage](#) Web site.

There are three available distribution types to use when installing for Windows. The contents in each case are identical, it is only the installation method which is different.

- Zipped installer consists of a Zipped package containing a standalone installation application. To install from this package, you must unzip the installer, and then run the installation application. See [Section 26.1.2.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- MSI installer, an installation file that can be used with the installer included in Windows 2000, Windows XP and Windows Server 2003. See [Section 26.1.2.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- Zipped DLL package, containing the DLL files that need must be manually installed. See [Section 26.1.2.1.2, “Installing the Windows Connector/ODBC Driver using the Zipped DLL package”](#) to complete the installation.

26.1.2.1.1. Installing the Windows Connector/ODBC Driver using an installer

The installer packages offer a very simple method for installing the Connector/ODBC drivers. If you have downloaded the zipped installer then you must extract the installer application. The basic installation process is identical for both installers.

You should follow these steps to complete the installation:

1. Double click on the standalone installer that you extracted, or the MSI file you downloaded.
2. The MySQL Connector/ODBC 3.51 - Setup Wizard will start. Click the NEXT button to begin the installation process.

3. You will need to choose the installation type. The Typical installation provides the standard files you will need to connect to a MySQL database using ODBC. The Complete option installs all the available files, including debug and utility components. It is recommended you choose one of these two options to complete the installation. If choose one of these methods, click NEXT and then proceed to step 5.

You may also choose a Custom installation, which enables you to select the individual components that you want to install. You have chosen this method, click NEXT and then proceed to step 4.

4. If you have chosen a custom installation, use the popups to select which components to install and then click NEXT to install the necessary files.

5. Once the files have copied to your machine, the installation is complete. Click FINISH to exit the installer.

Now the installation is complete, you can continue to configure your ODBC connections using [Section 26.1.3, “Connector/ODBC Configuration”](#).

26.1.2.1.2. Installing the Windows Connector/ODBC Driver using the Zipped DLL package

If you have downloaded the Zipped DLL package then you must install the individual files required for Connector/ODBC operation manually. Once you have unzipped the installation files, you can either perform this operation by hand, executing each statement individually, or you can use the included Batch file to perform an installation to the default locations.

To install using the Batch file:

1. Unzip the Connector/ODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Run `Install.bat`:

```
C:\> Install.bat
```

This will copy the necessary files into the default location, and then register the Connector/ODBC driver with the Windows ODBC manager.

If you want to copy the files to an alternative location - for example, to run or test different versions of the Connector/ODBC driver on the same machine, then you must copy the files by hand. It is however not recommended to install these files in a non-standard location. To copy the files by hand to the default installation location use the following steps:

1. Unzip the Connector/ODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Copy the library files to a suitable directory. The default is to copy them into the default Windows system directory `\Windows\System32`:

```
C:\> copy lib\myodbc3S.dll \Windows\System32
C:\> copy lib\myodbc3S.lib \Windows\System32
C:\> copy lib\myodbc3.dll \Windows\System32
C:\> copy lib\myodbc3.lib \Windows\System32
```

5. Copy the Connector/ODBC tools. These must be placed into a directory that is in the system `PATH`. The default is to install these into the Windows system directory `\Windows\System32`:

```
C:\> copy bin\myodbc3i.exe \Windows\System32
C:\> copy bin\myodbc3m.exe \Windows\System32
C:\> copy bin\myodbc3c.exe \Windows\System32
```

6. Optionally copy the help files. For these files to be accessible through the help system, they must be installed in the Windows system directory:

```
C:\> copy doc\*.hlp \Windows\System32
```

7. Finally, you must register the Connector/ODBC driver with the ODBC manager:

```
C:\> myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;\
DRIVER=myodbc3.dll;SETUP=myodbc3S.dll"
```

You must change the references to the DLL files and command location in the above statement if you have not installed these files into the default location.

26.1.2.1.3. Handling Installation Errors

On Windows, you may get the following error when trying to install the older MyODBC 2.50 driver:

```
An error occurred while copying C:\WINDOWS\SYSTEM\MFC30.DLL.
Restart Windows and try installing again (before running any
applications which use ODBC)
```

The reason for the error is that another application is currently using the ODBC system. Windows may not allow you to complete the installation. In most cases, you can continue by pressing **Ignore** to copy the rest of the Connector/ODBC files and the final installation should still work. If it doesn't, the solution is to re-boot your computer in "safe mode." Choose safe mode by pressing F8 just before your machine starts Windows during re-booting, install the Connector/ODBC drivers, and re-boot to normal mode.

26.1.2.2. Installing Connector/ODBC from a Binary Distribution on Unix

There are two methods available for installing Connector/ODBC on Unix from a binary distribution. For most Unix environments you will need to use the tarball distribution. For Linux systems, there is also an RPM distribution available.

26.1.2.2.1. Installing Connector/ODBC from a Binary Tarball Distribution

To install the driver from a tarball distribution (`.tar.gz` file), download the latest version of the driver for your operating system and follow these steps that demonstrate the process using the Linux version of the tarball:

```
shell> su root
shell> gunzip mysql-connector-odbc-3.51.11-i686-pc-linux.tar.gz
shell> tar xvf mysql-connector-odbc-3.51.11-i686-pc-linux.tar
```

```
shell> cd mysql-connector-odbc-3.51.11-i686-pc-linux
```

Read the installation instructions in the [INSTALL - BINARY](#) file and execute these commands.

```
shell> cp libmyodbc* /usr/local/lib
shell> cp odbc.ini /usr/local/etc
shell> export ODBCINI=/usr/local/etc/odbc.ini
```

Then proceed on to [Section 26.1.3.4, “Configuring a Connector/ODBC DSN on Unix”](#), to configure the DSN for Connector/ODBC. For more information, refer to the [INSTALL - BINARY](#) file that comes with your distribution.

26.1.2.2.2. Installing Connector/ODBC from an RPM Distribution

To install or upgrade Connector/ODBC from an RPM distribution on Linux, simply download the RPM distribution of the latest version of Connector/ODBC and follow the instructions below. Use `su root` to become `root`, then install the RPM file.

If you are installing for the first time:

```
shell> su root
shell> rpm -ivh mysql-connector-odbc-3.51.12.i386.rpm
```

If the driver exists, upgrade it like this:

```
shell> su root
shell> rpm -Uvh mysql-connector-odbc-3.51.12.i386.rpm
```

If there is any dependency error for MySQL client library, `libmysqlclient`, simply ignore it by supplying the `--nodeps` option, and then make sure the MySQL client shared library is in the path or set through `LD_LIBRARY_PATH`.

This installs the driver libraries and related documents to `/usr/local/lib` and `/usr/share/doc/MyODBC`, respectively. Proceed onto [Section 26.1.3.4, “Configuring a Connector/ODBC DSN on Unix”](#).

To **uninstall** the driver, become `root` and execute an `rpm` command:

```
shell> su root
shell> rpm -e mysql-connector-odbc
```

26.1.2.3. Installing Connector/ODBC from a Binary Distribution on Mac OS X

Mac OS X is based on the FreeBSD operating system, and you can normally use the MySQL network port for connecting to MySQL servers on other hosts. Installing the Connector/ODBC driver enables you to connect to MySQL databases on any platform through the ODBC interface. You should only need to install the Connector/ODBC driver when your application requires an ODBC interface. Applications that require or can use ODBC (and therefore the Connector/ODBC driver) include ColdFusion, Filemaker Pro, 4th Dimension and many other applications.

Mac OS X includes its own ODBC manager, based on the `iODBC` manager. Mac OS X includes an administration tool that provides easier administration of ODBC drivers and configuration, updating the underlying `iODBC` configuration files.

The method for installing Connector/ODBC on Mac OS X depends on the version on Connector/ODBC you are using. For Connector/ODBC 3.51.14 and later, the package is provided as a compress tar archive that you must manually install. For Connector/ODBC 3.51.13 and earlier the software was provided on a compressed disk image (`.dmg`) file and included an installer.

In either case, the driver is designed to work with the `iODBC` driver manager included with Mac OS X.

To install Connector/ODBC 3.51.14 and later:

1. Download the installation file. Note that versions are available for both PowerPC and Intel platforms.
2. Extract the archive:

```
$ tar zxf mysql-connector-odbc-3.51.16-osx10.4-x86-32bit.tar.gz
```

3. The directory created will contain two subdirectories, `lib` and `bin`. You need to copy these to a suitable location such as `/usr/local`:

```
$ cp bin/* /usr/local/bin  
$ cp lib/* /usr/local/lib
```

4. Finally, you must register the driver with iODBC using the [myodbc3i](#) tool you just installed:

```
$ myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;Driver=/usr/local/lib/libmyodbc3.so;Setup=/usr/local/lib/libmyodbc3S.so"
```

You can verify the installed drivers either by using the ODBC Administrator application or the [myodbc3i](#) utility:

```
$ myodbc3i -q -d
```

To install Connector/ODBC 3.51.13 and earlier, follow these steps:

1. Download the file to your computer and double-click on the downloaded image file.
2. Within the disk image you will find an installer package (with the [.pkg](#) extension). Double click on this file to start the Mac OS X installer.
3. You will be presented with the installer welcome message. Click the CONTINUE button to begin the installation process.

4. Please take the time to read the Important Information as it contains guidance on how to complete the installation process. Once you have read the notice and collected the necessary information, click CONTINUE.

5. Connector/ODBC drivers are made available under the GNU General Public License. Please read the license if you are not familiar with it before continuing installation. Click CONTINUE to approve the license (you will be asked to confirm that decision) and continue the installation.

6. Choose a location to install the Connector/ODBC drivers and the ODBC Administrator application. You must install the files onto a drive with an operating system and you may be limited in the choices available. Select the drive you want to use, and then click CONTINUE.

7. The installer will automatically select the files that need to be installed on your machine. Click **INSTALL** to continue. The installer will copy the necessary files to your machine. A progress bar will be shown indicating the installation progress.

8. When installation has been completed you will get a window like the one shown below. Click CLOSE to close and quit the installer.

26.1.2.4. Installing Connector/ODBC from a Source Distribution on Windows

You should only need to install Connector/ODBC from source on Windows if you want to change or modify the source or installation. If you are unsure whether to install from source, please use the binary installation detailed in [Section 26.1.2.1, “Installing Connector/ODBC from a Binary Distribution on Windows”](#).

Installing Connector/ODBC from source on Windows requires a number of different tools and packages:

- MDAC, Microsoft Data Access SDK from <http://www.microsoft.com/data/>.
- Suitable C compiler, such as Microsoft Visual C++ or the C compiler included with Microsoft Visual Studio.
- Compatible `make` tool. Microsoft's `nmake` is used in the examples in this section.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

26.1.2.4.1. Building Connector/ODBC 3.51

Connector/ODBC source distributions include `Makefiles` that require the `nmake` or other `make` utility. In the distribution, you can find `Makefile` for building the release version and `Makefile_debug` for building debugging versions of the driver libraries and DLLs.

To build the driver, use this procedure:

1. Download and extract the sources to a folder, then change directory into that folder. The following command assumes the folder is named `myodbc3-src`:

```
C:\> cd myodbc3-src
```

2. Edit `Makefile` to specify the correct path for the MySQL client libraries and header files. Then use the following commands to build and install the release version:

```
C:\> nmake -f Makefile
C:\> nmake -f Makefile install
```

`nmake -f Makefile` builds the release version of the driver and places the binaries in subdirectory called `Release`.

`nmake -f Makefile install` installs (copies) the driver DLLs and libraries (`myodbc3.dll`, `myodbc3.lib`) to your system directory.

3. To build the debug version, use `Makefile_Debug` rather than `Makefile`, as shown below:

```
C:\> nmake -f Makefile_debug
C:\> nmake -f Makefile_debug install
```

4. You can clean and rebuild the driver by using:

```
C:\> nmake -f Makefile clean
C:\> nmake -f Makefile install
```

Note

- Make sure to specify the correct MySQL client libraries and header files path in the Makefiles (set the `MYSQL_LIB_PATH` and `MYSQL_INCLUDE_PATH` variables). The default header file path is assumed to be `C:\mysql\include`. The default library path is assumed to be `C:\mysql\lib\opt` for release DLLs and `C:\mysql\lib\debug` for debug versions.
- For the complete usage of `nmake`, visit http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dv_vcce4/html/evgrfRunningNMAKE.asp.
- If you are using the Subversion tree for compiling, all Windows-specific `Makefiles` are named as `Win_Makefile*`.

26.1.2.4.2. Testing

After the driver libraries are copied/installed to the system directory, you can test whether the libraries are properly built by using the samples provided in the `samples` subdirectory:

```
C:\> cd samples
C:\> nmake -f Makefile all
```

26.1.2.4.3. Building MyODBC 2.50

The MyODBC 2.50 source distribution includes VC workspace files. You can build the driver using these files (`.dsp` and `.dsw`) directly by loading them from Microsoft Visual Studio 6.0 or higher.

26.1.2.5. Installing Connector/ODBC from a Source Distribution on Unix

You need the following tools to build MySQL from source on Unix:

- A working ANSI C++ compiler. `gcc` 2.95.2 or later, `egcs` 1.0.2 or later or `egcs 2.91.66`, SGI C++, and SunPro C++ are some of the compilers that are known to work.
- A good `make` program. GNU `make` is always recommended and is sometimes required.

- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

If you have built your own MySQL server and/or client libraries from source then you must have used the `-enable-thread-safe-client` option to `configure` when the libraries were built.

You should also ensure that the `libmysqlclient` library were built and installed as a shared library.

- A compatible ODBC manager must be installed. Connector/ODBC is known to work with the `iODBC` and `unixODBC` managers. See [Section 26.1.1.2.2, “ODBC Driver Managers”](#), for more information.
- If you are using a character set that isn't compiled into the MySQL client library then you need to install the MySQL character definitions from the `charsets` directory into `SHAREDIR` (by default, `/usr/local/mysql/share/mysql/charsets`). These should be in place if you have installed the MySQL server on the same machine. See [Chapter 9, Character Set Support](#), for more information on character set support.

Once you have all the required files, unpack the source files to a separate directory, you then have to run `configure` and build the library using `make`.

26.1.2.5.1. Typical `configure` Options

The `configure` script gives you a great deal of control over how you configure your Connector/ODBC build. Typically you do this using options on the `configure` command line. You can also affect `configure` using certain environment variables. For a list of options and environment variables supported by `configure`, run this command:

```
shell> ./configure --help
```

Some of the more commonly used `configure` options are described here:

- To compile Connector/ODBC, you need to supply the MySQL client include and library files path using the `-with-mysql-path=DIR` option, where `DIR` is the directory where MySQL is installed.

MySQL compile options can be determined by running `DIR/bin/mysql_config`.

- Supply the standard header and library files path for your ODBC Driver Manager (`iODBC` or `unixODBC`).
 - If you are using `iODBC` and `iODBC` is not installed in its default location (`/usr/local`), you might have to use the `-with-iodbc=DIR` option, where `DIR` is the directory where `iODBC` is installed.

If the `iODBC` headers do not reside in `DIR/include`, you can use the `--with-iodbc-includes=INCDIR` option to specify their location.

The applies to libraries. If they are not in `DIR/lib`, you can use the `--with-iodbc-libs=LIBDIR` option.

- If you are using `unixODBC`, use the `--with-unixODBC=DIR` option (case sensitive) to make `configure` look for `unixODBC` instead of `iODBC` by default, `DIR` is the directory where `unixODBC` is installed.
- If the `unixODBC` headers and libraries aren't located in `DIR/include` and `DIR/lib`, use the `-with-unixODBC-includes=INCDIR` and `--with-unixODBC-libs=LIBDIR` options.
- You might want to specify an installation prefix other than `/usr/local`. For example, to install the Connector/ODBC drivers in `/usr/local/odbc/lib`, use the `--prefix=/usr/local/odbc` option.

The final configuration command looks something like this:

```
shell> ./configure --prefix=/usr/local \
  --with-iodbc=/usr/local \
  --with-mysql-path=/usr/local/mysql
```

26.1.2.5.2. Additional `configure` Options

There are a number of other options that you need, or want, to set when configuring the Connector/ODBC driver before it is built.

- To link the driver with MySQL thread safe client libraries `libmysqlclient_r.so` or `libmysqlclient_r.a`, you must specify the following `configure` option:

```
--enable-thread-safe
```

and can be disabled (default) using

```
--disable-thread-safe
```

This option enables the building of the driver thread-safe library `libmyodbc3_r.so` from by linking with MySQL thread-safe client library `libmysqlclient_r.so` (The extensions are OS dependent).

If the compilation with the thread-safe option fails, it may be because the correct thread-libraries on the system could not be located. You should set the value of `LIBS` to point to the correct thread library for your system.

```
LIBS="-lpthread" ./configure ..
```

- You can enable or disable the shared and static versions of Connector/ODBC using these options:

```
--enable-shared[=yes/no]
--disable-shared
--enable-static[=yes/no]
--disable-static
```

- By default, all the binary distributions are built as non-debugging versions (configured with `--without-debug`).

To enable debugging information, build the driver from source distribution and use the `--with-debug` option when you run `configure`.

- This option is available only for source trees that have been obtained from the Subversion repository. This option does not apply to the packaged source distributions.

By default, the driver is built with the `--without-docs` option. If you would like the documentation to be built, then execute `configure` with:

```
--with-docs
```

26.1.2.5.3. Building and Compilation

To build the driver libraries, you have to just execute `make`.

```
shell> make
```

If any errors occur, correct them and continue the build process. If you aren't able to build, then send a detailed email to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com) for further assistance.

26.1.2.5.4. Building Shared Libraries

On most platforms, MySQL does not build or support `.so` (shared) client libraries by default. This is based on our experience of problems when building shared libraries.

In cases like this, you have to download the MySQL distribution and configure it with these options:

```
--without-server --enable-shared
```

To build shared driver libraries, you must specify the `--enable-shared` option for `configure`. By default, `configure` does not enable this option.

If you have configured with the `--disable-shared` option, you can build the `.so` file from the static libraries using the following

commands:

```
shell> cd mysql-connector-odbc-3.51.01
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error \
    -o .libs/libmyodbc3-3.51.01.so \
    catalog.o connect.o cursor.o dll.o error.o execute.o \
    handle.o info.o misc.o myodbc3.o options.o prepare.o \
    results.o transact.o utility.o \
    -L/usr/local/mysql/lib/mysql/ \
    -L/usr/local/iodbc/lib/ \
    -lz -lc -lmysqlclient -liodbcinst
```

Make sure to change `-liodbcinst` to `-lodbcinst` if you are using `unixODBC` instead of `iODBC`, and configure the library paths accordingly.

This builds and places the `libmyodbc3-3.51.01.so` file in the `.libs` directory. Copy this file to the Connector/ODBC library installation directory (`/usr/local/lib` (or the `lib` directory under the installation directory that you supplied with the `--prefix`).

```
shell> cd .libs
shell> cp libmyodbc3-3.51.01.so /usr/local/lib
shell> cd /usr/local/lib
shell> ln -s libmyodbc3-3.51.01.so libmyodbc3.so
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error \
    -o .libs/libmyodbc3_r-3.51.01.so \
    catalog.o connect.o cursor.o dll.o error.o execute.o \
    handle.o info.o misc.o myodbc3.o options.o prepare.o \
    results.o transact.o utility.o \
    -L/usr/local/mysql/lib/mysql/ \
    -L/usr/local/iodbc/lib/ \
    -lz -lc -lmysqlclient_r -liodbcinst
```

26.1.2.5.5. Installing Driver Libraries

To install the driver libraries, execute the following command:

```
shell> make install
```

That command installs one of the following sets of libraries:

For Connector/ODBC 3.51:

- `libmyodbc3.so`
- `libmyodbc3-3.51.01.so`, where 3.51.01 is the version of the driver
- `libmyodbc3.a`

For thread-safe Connector/ODBC 3.51:

- `libmyodbc3_r.so`
- `libmyodbc3-3_r.51.01.so`
- `libmyodbc3_r.a`

For MyODBC 2.5.0:

- `libmyodbc.so`

- `libmyodbc-2.50.39.so`, where 2.50.39 is the version of the driver
- `libmyodbc.a`

For more information on build process, refer to the [INSTALL](#) file that comes with the source distribution. Note that if you are trying to use the [make](#) from Sun, you may end up with errors. On the other hand, GNU [gmake](#) should work fine on all platforms.

26.1.2.5.6. Testing Connector/ODBC on Unix

To run the basic samples provided in the distribution with the libraries that you built, use the following command:

```
shell> make test
```

Before running the tests, create the DSN 'myodbc3' in `odbc.ini` and set the environment variable `ODBCINI` to the correct `odbc.ini` file; and MySQL server is running. You can find a sample `odbc.ini` with the driver distribution.

You can even modify the `samples/run-samples` script to pass the desired DSN, UID, and PASSWORD values as the command-line arguments to each sample.

26.1.2.5.7. Building Connector/ODBC from Source on Mac OS X

To build the driver on Mac OS X (Darwin), make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
--with-unixODBC=/usr/local
--with-mysql-path=/usr/local/mysql
--disable-shared
--enable-gui=no
--host=powerpc-apple
```

The command assumes that the `unixODBC` and MySQL are installed in the default locations. If not, configure accordingly.

On Mac OS X, `--enable-shared` builds `.dylib` files by default. You can build `.so` files like this:

```
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
$CC -bundle -flat_namespace -undefined error
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient -lz -lc
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
$CC -bundle -flat_namespace -undefined error
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient_r -lz -lc -lpthread
```

Make sure to change the `-liodbcinst` to `-lodbcinst` in case of using `unixODBC` instead of `iodbc` and configure the libraries path accordingly.

In Apple's version of GCC, both `cc` and `gcc` are actually symbolic links to `gcc3`.

Copy this library to the `$prefix/lib` directory and symlink to `libmyodbc3.so`.

You can cross-check the output shared-library properties using this command:

```
shell> otool -LD .libs/libmyodbc3-3.51.01.so
```

26.1.2.5.8. Building Connector/ODBC from Source on HP-UX

To build the driver on HP-UX 10.x or 11.x, make use of the following `configure` example:

If using `CC`:

```
shell> CC="cc" \
      CFLAGS="+z" \
      LDFLAGS="-Wl,+b:-Wl,+s" \
      ./configure --prefix=/usr/local
      --with-unixodbc=/usr/local
      --with-mysql-path=/usr/local/mysql/lib/mysql
      --enable-shared
      --enable-thread-safe
```

If using `gcc`:

```
shell> CC="gcc" \
      LDFLAGS="-Wl,+b:-Wl,+s" \
      ./configure --prefix=/usr/local
      --with-unixodbc=/usr/local
      --with-mysql-path=/usr/local/mysql
      --enable-shared
      --enable-thread-safe
```

Once the driver is built, cross-check its attributes using `chatr .libs/libmyodbc3.sl` to determine whether you need to have set the MySQL client library path using the `SHLIB_PATH` environment variable. For static versions, ignore all shared-library options and run `configure` with the `--disable-shared` option.

26.1.2.5.9. Building Connector/ODBC from Source on AIX

To build the driver on AIX, make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
      --with-unixodbc=/usr/local
      --with-mysql-path=/usr/local/mysql
      --disable-shared
      --enable-thread-safe
```

Note

For more information about how to build and set up the static and shared libraries across the different platforms refer to '[Using static and shared libraries across platforms](#)'.

26.1.2.6. Installing Connector/ODBC from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/ODBC up and running on your system, you should use a standard release distribution.

To be able to access the Connector/ODBC source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

To build from the source trees, you need the following tools:

- autoconf 2.52 (or newer)
- automake 1.4 (or newer)
- libtool 1.4 (or newer)
- m4

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/ODBC sources, change to the directory where you want the copy of the Connector/ODBC tree to be stored, then use the following command:

```
shell> svn co http://svn.mysql.com/svnpublic/connector-odbc3
```

You should now have a copy of the entire Connector/ODBC source tree in the directory `connector-odbc3`. To build from this source tree on Unix or Linux follow these steps:

```
shell> cd connector-odbc3
shell> aclocal
shell> autoheader
shell> autoconf
shell> automake;
shell> ./configure # Add your favorite options here
shell> make
```

For more information on how to build, refer to the `INSTALL` file located in the same directory. For more information on options to `configure`, see [Section 26.1.2.5.1, “Typical configure Options”](#)

When the build is done, run `make install` to install the Connector/ODBC 3.51 driver on your system.

If you have gotten to the `make` stage and the distribution does not compile, please report it to <myodbc@lists.mysql.com>.

On Windows, make use of Windows Makefiles `WIN-Makefile` and `WIN-Makefile_debug` in building the driver. For more information, see [Section 26.1.2.4, “Installing Connector/ODBC from a Source Distribution on Windows”](#).

After the initial checkout operation to get the source tree, you should run `svn update` periodically update your source according to the latest version.

26.1.3. Connector/ODBC Configuration

Before you connect to a MySQL database using the Connector/ODBC driver you must configure an ODBC *Data Source Name*. The DSN associates the various configuration parameters required to communicate with a database to a specific name. You use the DSN in an application to communicate with the database, rather than specifying individual parameters within the application itself. DSN information can be user specific, system specific, or provided in a special file. ODBC data source names are configured in different ways, depending on your platform and ODBC driver.

26.1.3.1. Data Source Names

A Data Source Name associates the configuration parameters for communicating with a specific database. Generally a DSN consists of the following parameters:

- Name
- Hostname
- Database Name
- Login
- Password

In addition, different ODBC drivers, including Connector/ODBC, may accept additional driver-specific options and parameters.

There are three types of DSN:

- A *System DSN* is a global DSN definition that is available to any user and application on a particular system. A System DSN can normally only be configured by a systems administrator, or by a user who has specific permissions that let them create System DSNs.
- A *User DSN* is specific to an individual user, and can be used to store database connectivity information that the user regularly uses.
- A *File DSN* uses a simple file to define the DSN configuration. File DSNs can be shared between users and machines and are therefore more practical when installing or deploying DSN information as part of an application across many machines.

DSN information is stored in different locations depending on your platform and environment.

26.1.3.2. Configuring a Connector/ODBC DSN on Windows

The **ODBC Data Source Administrator** within Windows enables you to create DSNs, check driver installation and configure ODBC systems such as tracing (used for debugging) and connection pooling.

Different editions and versions of Windows store the **ODBC Data Source Administrator** in different locations depending on the version of Windows that you are using.

To open the **ODBC Data Source Administrator** in Windows Server 2003:

1. On the **Start** menu, choose **Administrative Tools**, and then click **Data Sources (ODBC)**.

To open the **ODBC Data Source Administrator** in Windows 2000 Server or Windows 2000 Professional:

1. On the **Start** menu, choose **Settings**, and then click **Control Panel**.
2. In **Control Panel**, click **Administrative Tools**.
3. In **Administrative Tools**, click **Data Sources (ODBC)**.

To open the **ODBC Data Source Administrator** on Windows XP:

1. On the **Start** menu, click **Control Panel**.
2. In the **Control Panel** when in **Category View** click **Performance and Maintenance** and then click **Administrative Tools**.. If you are viewing the **Control Panel** in **Classic View**, click **Administrative Tools**.
3. In **Administrative Tools**, click **Data Sources (ODBC)**.

Irrespective of your Windows version, you should be presented the **ODBC Data Source Administrator** window:

Within Windows XP, you can add the [Administrative Tools](#) folder to your START menu to make it easier to locate the ODBC Data Source Administrator. To do this:

1. Right click on the START menu.
2. Select [Properties](#).
3. Click CUSTOMIZE....
4. Select the ADVANCED tab.
5. Within [Start menu items](#), within the [System Administrative Tools](#) section, select [Display on the All Programs menu](#).

Within both Windows Server 2003 and Windows XP you may want to permanently add the [ODBC Data Source Administrator](#) to your START menu. To do this, locate the [Data Sources \(ODBC\)](#) icon using the methods shown, then right-click on the icon and then choose PIN TO START MENU.

26.1.3.2.1. Adding a Connector/ODBC DSN on Windows

To add and configure a new Connector/ODBC data source on Windows, use the [ODBC Data Source Administrator](#):

1. Open the [ODBC Data Source Administrator](#).

2. To create a System DSN (which will be available to all users) , select the [System DSN](#) tab. To create a User DSN, which will be unique only to the current user, click the [ADD...](#) button.
3. You will need to select the ODBC driver for this DSN.

Select [MySQL ODBC 3.51 Driver](#), then click [Finish](#).

4. You now need to configure the specific fields for the DSN you are creating through the [Add Data Source Name](#) dialog.

In the **Data Source Name** box, enter the name of the data source you want to access. It can be any valid name that you choose.

5. In the **Description** box, enter some text to help identify the connection.
6. In the **Server** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
7. In the **User** field, enter the user name to use for this connection.
8. In the **Password** field, enter the corresponding password for this connection.
9. The **Database** popup should automatically populate with the list of databases that the user has permissions to access.
10. Click OK to save the DSN.

A completed DSN configuration may look like this:

26.1.3.2.2. Checking Connector/ODBC DSN Configuration on Windows

You can verify the connection using the parameters you have entered by clicking the TEST button. If the connection could be made successfully, you will be notified with a **Success; connection was made!** dialog.

If the connection failed, you can obtain more information on the test and why it may have failed by clicking the DIAGNOSTICS... button to show additional error messages.

26.1.3.2.3. Connector/ODBC DSN Configuration Options

You can configure a number of options for a specific DSN by using either the CONNECT OPTIONS or ADVANCED tabs in the DSN configuration dialog.

The CONNECTION OPTIONS dialog can be seen below.

The three options you can configure are:

- **Port** sets the TCP/IP port number to use when communicating with MySQL. Communication with MySQL uses port 3306 by default. If your server is configured to use a different TCP/IP port, you must specify that port number here.
- **Socket** sets the name or location of a specific socket or Windows pipe to use when communicating with MySQL.
- **Initial Statement** defines an SQL statement that will be executed when the connection to MySQL is opened. You can use this to set MySQL options for your connection, such as disabling autocommit.
- **Character Set** is a popup list from which you can select the default character set to be used with this connection. The Character Set option was added in 3.5.17.

The **ADVANCED** tab enables you to configure Connector/ODBC connection parameters. Refer to [Section 26.1.3.5, “Connector/ODBC Connection Parameters”](#), for information about the meaning of these options.

26.1.3.2.4. Errors and Debugging

This section answers Connector/ODBC connection-related questions.

- **While configuring a Connector/ODBC DSN, a `Could Not Load Translator or Setup Library` error occurs**

For more information, refer to [MS KnowledgeBase Article\(Q260558\)](#). Also, make sure you have the latest valid `ct13d32.dll` in your system directory.

- On Windows, the default `myodbc3.dll` is compiled for optimal performance. If you want to debug Connector/ODBC 3.51 (for example, to enable tracing), you should instead use `myodbc3d.dll`. To install this file, copy `myodbc3d.dll` over the installed `myodbc3.dll` file. Make sure to revert back to the release version of the driver DLL once you are done with the debugging because the debug version may cause performance issues. Note that the `myodbc3d.dll` isn't included in Connector/ODBC 3.51.07 through 3.51.11. If you are using one of these versions, you should copy that DLL from a previous version (for example, 3.51.06).

For MyODBC 2.50, `myodbc.dll` and `myodbcd.dll` are used instead.

26.1.3.3. Configuring a Connector/ODBC DSN on Mac OS X

To configure a DSN on Mac OS X you can either use the `myodbc3i` utility, edit the `odbc.ini` file within the `Library/ODBC` directory of the user or the should use the ODBC Administrator. If you have Mac OS X 10.2 or earlier, refer to [Section 26.1.3.4, “Configuring a Connector/ODBC DSN on Unix”](#). Select whether you want to create a User DSN or a System DSN. If you want to add a System DSN, you may need to authenticate with the system. You must click the padlock and enter a user and password with administrator privileges.

Warning

There are known issues with the OS X ODBC Administrator and Connector/ODBC that may prevent you from creating a DSN using this method. In this case you should use the command-line or edit the `odbc.ini` file directly. Note that existing DSNs or those that you create via the `myodbc3i` tool can still be checked and edited using ODBC Administrator.

To create a DSN using the `myodbc3i` utility, you need only specify the DSN type and the DSN connection string. For example:

```
$ myodbc3i -a -s -t "DSN=mydb;DRIVER=MySQL ODBC 3.51 Driver;SERVER=mysql;USER=username;PASSWORD=pass"
```

To use ODBC Administrator:

1. Open the ODBC Administrator from the [Utilities](#) folder in the [Applications](#) folder.

2. On the User DSN or System DSN panel, click ADD.
3. Select the Connector/ODBC driver and click OK.
4. You will be presented with the [Data Source Name](#) dialog. Enter The [Data Source Name](#) and an optional [Description](#) for the DSN.

5. Click **ADD** to add a new keyword/value pair to the panel. You should configure at least four pairs to specify the [server](#), [user-name](#), [password](#) and [database](#) connection parameters. See [Section 26.1.3.5, “Connector/ODBC Connection Parameters”](#).
6. Click **OK** to add the DSN to the list of configured data source names.

A completed DSN configuration may look like this:

Data Source Name (DSN): **WorldSample**

Description: **Connection to sample World database**

Keyword	Value
server	mysql
user	sakila
password	Sample
database	test_world

Buttons: Add, Remove, Cancel, OK

You can configure additional ODBC options to your DSN by adding further keyword/value pairs and setting the corresponding values. See [Section 26.1.3.5, “Connector/ODBC Connection Parameters”](#).

26.1.3.4. Configuring a Connector/ODBC DSN on Unix

On **Unix**, you configure DSN entries directly in the `odbc.ini` file. Here is a typical `odbc.ini` file that configures `myodbc` and `myodbc3` as the DSN names for MyODBC 2.50 and Connector/ODBC 3.51, respectively:

```

;
; odbc.ini configuration for Connector/ODBC and Connector/ODBC 3.51 drivers
;
[ODBC Data Sources]
myodbc      = MyODBC 2.50 Driver DSN
myodbc3     = MyODBC 3.51 Driver DSN

[myodbc]
Driver      = /usr/local/lib/libmyodbc.so
Description = MyODBC 2.50 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

[myodbc3]
Driver      = /usr/local/lib/libmyodbc3.so
Description = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

[Default]
Driver      = /usr/local/lib/libmyodbc3.so
Description = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3

```

SOCKET =

Refer to the [Section 26.1.3.5, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

Note

If you are using [unixODBC](#), you can use the following tools to set up the DSN:

- ODBCConfig GUI tool([HOWTO: ODBCConfig](#))
- `odbcinst`

In some cases when using [unixODBC](#), you might get this error:

```
Data source name not found and no default driver specified
```

If this happens, make sure the `ODBCINI` and `ODBCSYSINI` environment variables are pointing to the right `odbc.ini` file. For example, if your `odbc.ini` file is located in `/usr/local/etc`, set the environment variables like this:

```
export ODBCINI=/usr/local/etc/odbc.ini
export ODBCSYSINI=/usr/local/etc
```

26.1.3.5. Connector/ODBC Connection Parameters

You can specify the parameters in the following tables for Connector/ODBC when configuring a DSN. Users on Windows can use the Options and Advanced panels when configuring a DSN to set these parameters; see the table for information on which options relate to which fields and checkboxes. On Unix and Mac OS X, use the parameter name and value as the keyword/value pair in the DSN configuration. Alternatively, you can set these parameters within the `InConnectionString` argument in the `SQLDriverConnect()` call.

Parameter	Default Value	Comment
<code>user</code>	ODBC (on Windows)	The username used to connect to MySQL.
<code>uid</code>	ODBC (on Windows)	Synonymous with <code>user</code> . Added in 3.51.16.
<code>server</code>	<code>localhost</code>	The hostname of the MySQL server.
<code>database</code>		The default database.
<code>option</code>	0	Options that specify how Connector/ODBC should work. See below.
<code>port</code>	3306	The TCP/IP port to use if <code>server</code> is not <code>localhost</code> .
<code>stmt</code>		A statement to execute when connecting to MySQL.
<code>password</code>		The password for the <code>user</code> account on <code>server</code> .
<code>pwd</code>		Synonymous with <code>password</code> . Added in 3.51.16.
<code>socket</code>		The Unix socket file or Windows named pipe to connect to if <code>server</code> is <code>localhost</code> .
<code>sslca</code>		The path to a file with a list of trust SSL CAs. Added in 3.51.16.
<code>sslcapath</code>		The path to a directory that contains trusted SSL CA certificates in PEM format. Added in 3.51.16.
<code>sslcert</code>		The name of the SSL certificate file to use for establishing a secure connection. Added in 3.51.16.
<code>sslcipher</code>		A list of allowable ciphers to use for SSL encryption. The cipher list has the same format as the <code>openssl ciphers</code> command. Added in 3.51.16.
<code>sslkey</code>		The name of the SSL key file to use for establishing a secure connection. Added in 3.51.16.
<code>charset</code>		The character set to use for the connection. Added in 3.51.17.

Note

The SSL configuration parameters can also be automatically loaded from a `my.ini` or `my.cnf` file.

The `option` argument is used to tell Connector/ODBC that the client isn't 100% ODBC compliant. On Windows, you normally select options by toggling the checkboxes in the connection screen, but you can also select them in the `option` argument. The following options are listed in the order in which they appear in the Connector/ODBC connect screen:

Value	Flagname	GUI Option	Description
1	<code>FLAG_FIELD_LENGTH</code>	Don't Optimize Column Width	The client can't handle that Connector/ODBC returns the real width of a column.
2	<code>FLAG_FOUND_ROWS</code>	Return Matching Rows	The client can't handle that MySQL returns the true value of affected rows. If this flag is set, MySQL returns "found rows" instead. You must have MySQL 3.21.14 or newer to get this to work.
4	<code>FLAG_DEBUG</code>	Trace Driver Calls To myodbc.log	Make a debug log in <code>C:\myodbc.log</code> on Windows, or <code>/tmp/myodbc.log</code> on Unix variants.
8	<code>FLAG_BIG_PACKETS</code>	Allow Big Results	Don't set any packet limit for results and parameters.
16	<code>FLAG_NO_PROMPT</code>	Don't Prompt Upon Connect	Don't prompt for questions even if driver would like to prompt.
32	<code>FLAG_DYNAMIC_CURSOR</code>	Enable Dynamic Cursor	Enable or disable the dynamic cursor support. (Not allowed in Connector/ODBC 2.50.)
64	<code>FLAG_NO_SCHEMA</code>	Ignore # in Table Name	Ignore use of database name in <code>db_name.tbl_name.col_name</code> .
128	<code>FLAG_NO_DEFAULT_CURSOR</code>	User Manager Cursors	Force use of ODBC manager cursors (experimental).
256	<code>FLAG_NO_LOCALE</code>	Don't Use Set Locale	Disable the use of extended fetch (experimental).
512	<code>FLAG_PAD_SPACE</code>	Pad Char To Full Length	Pad <code>CHAR</code> columns to full column length.
1024	<code>FLAG_FULL_COLUMN_NAMES</code>	Return Table Names for SQLDescribeCol	<code>SQLDescribeCol()</code> returns fully qualified column names.
2048	<code>FLAG_COMPRESSED_PROTOCOL</code>	Use Compressed Protocol	Use the compressed client/server protocol.
4096	<code>FLAG_IGNORE_SPACE</code>	Ignore Space After Function Names	Tell server to ignore space after function name and before '(' (needed by PowerBuilder). This makes all function names keywords.
8192	<code>FLAG_NAMED_PIPE</code>	Force Use of Named Pipes	Connect with named pipes to a <code>mysqld</code> server running on NT.
16384	<code>FLAG_NO_BIGINT</code>	Change BIGINT Columns to Int	Change <code>BIGINT</code> columns to <code>INT</code> columns (some applications can't handle <code>BIGINT</code>).
32768	<code>FLAG_NO_CATALOG</code>	No Catalog	Forces results from the catalog functions, such as <code>SQLTables</code> , to always return <code>NULL</code> and the driver to report that catalogs are not supported.
65536	<code>FLAG_USE_MYCNF</code>	Read Options From my.cnf	Read parameters from the <code>[client]</code> and <code>[odbc]</code> groups from <code>my.cnf</code> .
131072	<code>FLAG_SAFE</code>	Safe	Add some extra safety checks.
262144	<code>FLAG_NO_TRANSACTIONS</code>	Disable transactions	Disable transactions.
524288	<code>FLAG_LOG_QUERY</code>	Save queries to myodbc.sql	Enable query logging to <code>c:\myodbc.sql(/tmp/myodbc.sql)</code> file. (Enabled only in debug mode.)
1048576	<code>FLAG_NO_CACHE</code>	Don't Cache Result (forward only cursors)	Do not cache the results locally in the driver, instead read from server (<code>mysql_use_result()</code>). This works only for forward-only cursors. This option is very important in dealing with large tables when you don't want the driver to cache the entire result set.
2097152	<code>FLAG_FORWARD_CURSOR</code>	Force Use Of Forward Only Cursors	Force the use of <code>Forward-only</code> cursor type. In case of applications setting the default static/dynamic cursor type, and one wants

			the driver to use non-cache result sets, then this option ensures the forward-only cursor behavior.
4194304	FLAG_AUTO_RECONNECT	Enable auto-reconnect.	Enables auto-reconnection functionality. You should not use this option with transactions, since a auto reconnection during a incomplete transaction may cause corruption. Note that an auto-reconnected connection will not inherit the same settings and environment as the original. This option was enabled in Connector/ODBC 3.5.13.
8388608	FLAG_AUTO_IS_NULL	Flag Auto Is Null	When set, this option causes the connection to set the SQL_AUTO_IS_NULL option to 1. This disables the standard behavior, but may enable older applications to correctly identify AUTO_INCREMENT values. For more information. See IS NULL . This option was enabled in Connector/ODBC 3.5.13.
16777216	FLAG_ZERO_DATE_TO_MIN	Flag Zero Date to Min	Translates zero dates (XXXX-00-00) into the minimum date values supported by ODBC, XXXX-01-01 . This resolves an issue where some statement swill not work because the date returned and the minimumd ODBC date value are incompatible. This option was enabled in Connector/ODBC 3.5.17.
33554432	FLAG_MIN_DATE_TO_ZERO	Flag Min Date to Zero	Translates the minimum ODBC date value (XXXX-01-01) to the zero date format supported by MySQL (XXXX-00-00). This resolves an issue where some statement swill not work because the date returned and the minimumd ODBC date value are incompatible. This option was enabled in Connector/ODBC 3.5.17.
67108864	FLAG_MULTI_STATEMENTS	Allow multiple statements	Enables support for batched statements. This option was enabled in Connector/ODBC 3.5.18.

To select multiple options, add together their values. For example, setting [option](#) to 12 (4+8) gives you debugging without packet limits.

The following table shows some recommended [option](#) values for various configurations:

Configuration	Option Value
Microsoft Access, Visual Basic	3
Driver trace generation (Debug mode)	4
Microsoft Access (with improved DELETE queries)	35
Large tables with too many rows	2049
Sybase PowerBuilder	135168
Query log generation (Debug mode)	524288
Generate driver trace as well as query log (Debug mode)	524292
Large tables with no-cache results	3145731

26.1.3.6. Connecting Without a Predefined DSN

You can connect to the MySQL server using `SQLDriverConnect`, by specifying the [DRIVER](#) name field. Here are the connection strings for Connector/ODBC using DSN-Less connections:

For MyODBC 2.50:

```
ConnectionString = "DRIVER={MySQL};\
SERVER=localhost;\
DATABASE=test;\
USER=venu;\
PASSWORD=venu;\
OPTION=3;"
```

For Connector/ODBC 3.51:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};\n    SERVER=localhost;\n    DATABASE=test;\n    USER=venu;\n    PASSWORD=venu;\n    OPTION=3;"
```

If your programming language converts backslash followed by whitespace to a space, it is preferable to specify the connection string as a single long string, or to use a concatenation of multiple strings that does not add spaces in between. For example:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};"\n    "SERVER=localhost;"\n    "DATABASE=test;"\n    "USER=venu;"\n    "PASSWORD=venu;"\n    "OPTION=3;"
```

Note. Note that on Mac OS X you may need to specify the full path to the Connector/ODBC driver library.

Refer to the [Section 26.1.3.5, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

26.1.3.7. ODBC Connection Pooling

Connection pooling enables the ODBC driver to re-use existing connections to a given database from a pool of connections, instead of opening a new connection each time the database is accessed. By enabling connection pooling you can improve the overall performance of your application by lowering the time taken to open a connection to a database in the connection pool.

For more information about connection pooling: <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q169470>.

26.1.3.8. Getting an ODBC Trace File

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) and Connector/ODBC. This is called *tracing*, and is enabled through the ODBC Manager. The procedure for this differs for Windows, Mac OS X and Unix.

26.1.3.8.1. Enabling ODBC Tracing on Windows

To enable the trace option on Windows:

1. The [Tracing](#) tab of the ODBC Data Source Administrator dialog box enables you to configure the way ODBC function calls are traced.

2. When you activate tracing from the **Tracing** tab, the **Driver Manager** logs all ODBC function calls for all subsequently run applications.
3. ODBC function calls from applications running before tracing is activated are not logged. ODBC function calls are recorded in a log file you specify.
4. Tracing ceases only after you click **Stop Tracing Now**. Remember that while tracing is on, the log file continues to increase in size and that tracing affects the performance of all your ODBC applications.

26.1.3.8.2. Enabling ODBC Tracing on Mac OS X

To enable the trace option on Mac OS X 10.3 or later you should use the **Tracing** tab within ODBC Administrator .

1. Open the ODBC Administrator.
2. Select the **Tracing** tab.

3. Select the **Enable Tracing** checkbox.
4. Enter the location where you want to save the Tracing log. If you want to append information to an existing log file, click the **CHOOSE...** button.

26.1.3.8.3. Enabling ODBC Tracing on Unix

To enable the trace option on Mac OS X 10.2 (or earlier) or Unix you must add the **trace** option to the ODBC configuration:

1. On Unix, you need to explicitly set the **Trace** option in the **ODBC.INI** file.

Set the tracing **ON** or **OFF** by using **TraceFile** and **Trace** parameters in **odbc.ini** as shown below:

```
TraceFile = /tmp/odbc.trace
Trace     = 1
```

TraceFile specifies the name and full path of the trace file and **Trace** is set to **ON** or **OFF**. You can also use **1** or **YES** for **ON** and **0** or **NO** for **OFF**. If you are using **ODBCConfig** from **unixODBC**, then follow the instructions for tracing **unixODBC** calls at [HOWTO-ODBCConfig](#).

26.1.3.8.4. Enabling a Connector/ODBC Log

To generate a Connector/ODBC log, do the following:

1. Within Windows, enable the **Trace Connector/ODBC** option flag in the Connector/ODBC connect/configure screen. The log is written to file **C:\myodbc.log**. If the trace option is not remembered when you are going back to the above screen, it means

that you are not using the `myodbc.dll` driver, see [Section 26.1.3.2.4, “Errors and Debugging”](#).

On Mac OS X, Unix, or if you are using DSN-Less connection, then you need to supply `OPTION=4` in the connection string or set the corresponding keyword/value pair in the DSN.

2. Start your application and try to get it to fail. Then check the Connector/ODBC trace file to find out what could be wrong.

If you need help determining what is wrong, see [Section 26.1.7.1, “Connector/ODBC Community Support”](#).

26.1.4. Connector/ODBC Examples

Once you have configured a DSN to provide access to a database, how you access and use that connection is dependent on the application or programming language. As ODBC is a standardized interface, any application or language that supports ODBC can use the DSN and connect to the configured database.

26.1.4.1. Basic Connector/ODBC Application Steps

Interacting with a MySQL server from an applications using the Connector/ODBC typically involves the following operations:

- Configure the Connector/ODBC DSN
- Connect to MySQL server
- Initialization operations
- Execute SQL statements
- Retrieve results
- Perform Transactions
- Disconnect from the server

Most applications use some variation of these steps. The basic application steps are shown in the following diagram:

26.1.4.2. Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC

A typical installation situation where you would install Connector/ODBC is when you want to access a database on a Linux or Unix host from a Windows machine.

As an example of the process required to set up access between two machines, the steps below take you through the basic steps. These instructions assume that you want to connect to system ALPHA from system BETA with a username and password of **myuser** and **mypassword**.

On system ALPHA (the MySQL server) follow these steps:

1. Start the MySQL server.
2. Use **GRANT** to set up an account with a username of **myuser** that can connect from system BETA using a password of **myuser** to the database **test**:

```
GRANT ALL ON test.* to 'myuser'@'BETA' IDENTIFIED BY 'mypassword';
```

For more information about MySQL privileges, refer to [Section 5.8, “MySQL User Account Management”](#).

On system BETA (the Connector/ODBC client), follow these steps:

1. Configure a Connector/ODBC DSN using parameters that match the server, database and authentication information that you have just configured on system ALPHA.

Parameter	Value	Comment
DSN	remote_test	A name to identify the connection.
SERVER	ALPHA	The address of the remote server.
DATABASE	test	The name of the default database.
USER	myuser	The username configured for access to this database.
PASSWORD	mypassword	The password for myuser .

2. Using an ODBC-capable application, such as Microsoft Office, connect to the MySQL server using the DSN you have just created. If the connection fails, use tracing to examine the connection process. See [Section 26.1.3.8, “Getting an ODBC Trace File”](#), for more information.

26.1.4.3. Connector/ODBC and Third-Party ODBC Tools

Once you have configured your Connector/ODBC DSN, you can access your MySQL database through any application that supports the ODBC interface, including programming languages and third-party applications. This section contains guides and help on using Connector/ODBC with various ODBC-compatible tools and applications, including Microsoft Word, Microsoft Excel and Adobe/Macromedia ColdFusion.

Connector/ODBC has been tested with the following applications:

Publisher	Application	Notes
Adobe	ColdFusion	Formerly Macromedia ColdFusion
Borland	C++ Builder	
	Builder 4	
	Delphi	
Business Objects	Crystal Reports	
Claris	Filemaker Pro	
Corel	Paradox	
Computer Associates	Visual Objects	Also known as CAVO
	AllFusion ERwin Data Modeler	

Gupta	Team Developer	Previously known as Centura Team Developer; Gupta SQL/Windows
Gensym	G2-ODBC Bridge	
Inline	iHTML	
Lotus	Notes	Versions 4.5 and 4.6
Microsoft	Access	
	Excel	
	Visio Enterprise	
	Visual C++	
	Visual Basic	
	ODBC.NET	Using C#, Visual Basic, C++
	FoxPro	
	Visual Interdev	
OpenOffice.org	OpenOffice.org	
Perl	DBD::ODBC	
Pervasive Software	DataJunction	
Sambar Technologies	Sambar Server	
SPSS	SPSS	
SoftVelocity	Clarion	
SQLExpress	SQLExpress for Xbase++	
Sun	StarOffice	
SunSystems	Vision	
Sybase	PowerBuilder	
	PowerDesigner	
theKompany.com	Data Architect	

If you know of any other applications that work with Connector/ODBC, please send mail to <myodbc@lists.mysql.com> about them.

26.1.4.4. Using Connector/ODBC with Microsoft Access

You can use MySQL database with Microsoft Access using Connector/ODBC. The MySQL database can be used as an import source, an export source, or as a linked table for direct use within an Access application, so you can use Access as the front-end interface to a MySQL database.

26.1.4.4.1. Exporting Access Data to MySQL

To export a table of data from an Access database to MySQL, follow these instructions:

1. When you open an Access database or an Access project, a Database window appears. It displays shortcuts for creating new database objects and opening existing objects.

2. Click the name of the [table](#) or [query](#) you want to export, and then in the **File** menu, select **Export**.
3. In the **Export Object Type Object name To** dialog box, in the **Save As Type** box, select **ODBC Databases ()** as shown here:

4. In the **Export** dialog box, enter a name for the file (or use the suggested name), and then select **OK**.
5. The **Select Data Source** dialog box is displayed; it lists the defined data sources for any ODBC drivers installed on your computer. Click either the **File Data Source** or **Machine Data Source** tab, and then double-click the **Connector/ODBC** or **Connector/ODBC 3.51** data source that you want to export to. To define a new data source for **Connector/ODBC**, please [Section 26.1.3.2, "Configuring a Connector/ODBC DSN on Windows"](#).

Microsoft Access connects to the MySQL Server through this data source and exports new tables and or data.

26.1.4.4.2. Importing MySQL Data to Access

To import a table or tables from MySQL to Access, follow these instructions:

1. Open a database, or switch to the Database window for the open database.
2. To import tables, on the **File** menu, point to **Get External Data**, and then click **Import**.
3. In the **Import** dialog box, in the Files Of Type box, select **ODBC DATABASES ()**. The Select Data Source dialog box lists the defined data sources **THE SELECT DATA SOURCE** dialog box is displayed; it lists the defined data source names.
4. If the ODBC data source that you selected requires you to log on, enter your login ID and password (additional information might also be required), and then click **OK**.
5. Microsoft Access connects to the MySQL server through **ODBC data source** and displays the list of tables that you can **import**.
6. Click each table that you want to **import**, and then click **OK**.

26.1.4.4.3. Using Microsoft Access as a Front-end to MySQL

You can use Microsoft Access as a front end to a MySQL database by linking tables within your Microsoft Access database to tables that exist within your MySQL database. When a query is requested on a table within Access, ODBC is used to execute the queries on the MySQL database instead.

To create a linked table:

1. Open the Access database that you want to link to MySQL.
2. From the **FILE**, choose **GET EXTERNAL DATA->LINK TABLES**.

3. From the browser, choose **ODBC DATABASES ()** from the **FILES OF TYPE** popup.
4. In the **SELECT DATA SOURCE** window, choose an existing DSN, either from a **FILE DATA SOURCE** or **MACHINE DATA SOURCE**. You can also create a new DSN using the **NEW...** button. For more information on creating a DSN see [Section 26.1.3.2](#),

“Configuring a Connector/ODBC DSN on Windows”.

5. In the **LINK TABLES** dialog, select one or more tables from the MySQL database. A link will be created to each table that you select from this list.

6. If Microsoft Access is unable to determine the unique record identifier for a table automatically then it may ask you to confirm the column, or combination of columns, to be used to uniquely identify each row from the source table. Select the columns you want to use and click OK.

Once the process has been completed, you can now build interfaces and queries to the linked tables just as you would for any Access database.

Use the following procedure to view or to refresh links when the structure or location of a linked table has changed. The Linked Table Manager lists the paths to all currently linked tables.

To view or refresh links:

1. Open the database that contains links to MySQL tables.
2. On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer), and then click **Linked Table Manager**.
3. Select the check box for the tables whose links you want to refresh.
4. Click OK to refresh the links.

Microsoft Access confirms a successful refresh or, if the table wasn't found, displays the **Select New Location of <table name>** dialog box in which you can specify its the table's new location. If several selected tables have moved to the new location that you specify, the Linked Table Manager searches that location for all selected tables, and updates all links in one step.

To change the path for a set of linked tables:

1. Open the database that contains links to tables.
2. On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer), and then click **Linked Table Manager**.
3. Select the **Always Prompt For A New Location** check box.
4. Select the check box for the tables whose links you want to change, and then click **OK**.
5. In the **Select New Location of <table name>** dialog box, specify the new location, click **Open**, and then click **OK**.

26.1.4.5. Using Connector/ODBC with Microsoft Word or Excel

You can use Microsoft Word and Microsoft Excel to access information from a MySQL database using Connector/ODBC. Within Microsoft Word, this facility is most useful when importing data for mailmerge, or for tables and data to be included in reports. Within Microsoft Excel, you can execute queries on your MySQL server and import the data directly into an Excel Worksheet, presenting the data as a series of rows and columns.

With both applications, data is accessed and imported into the application using Microsoft Query , which enables you to execute a query through an ODBC source. You use Microsoft Query to build the SQL statement to be executed, selecting the tables, fields, selection criteria and sort order. For example, to insert information from a table in the World test database into an Excel spreadsheet, using the DSN samples shown in [Section 26.1.3, “Connector/ODBC Configuration”](#):

1. Create a new Worksheet.
2. From the **Data** menu, choose **Import External Data**, and then select **New Database Query**.
3. Microsoft Query will start. First, you need to choose the data source, by selecting an existing Data Source Name.

4. Within the [Query Wizard](#), you must choose the columns that you want to import. The list of tables available to the user configured through the DSN is shown on the left, the columns that will be added to your query are shown on the right. The columns you choose are equivalent to those in the first section of a [SELECT](#) query. Click NEXT to continue.

5. You can filter rows from the query (the equivalent of a [WHERE](#) clause) using the [Filter Data](#) dialog. Click NEXT to continue.

Query Wizard - Filter Data

Filter the data to specify which rows to include in your query.
If you don't want to filter the data, click Next.

Column to filter: **Name**
CountryCode
District
Population

Only include rows where:

Name

[Dropdown] [Dropdown]

☐ And ☐ Or

[Dropdown] [Dropdown]

☐ And ☐ Or

[Dropdown] [Dropdown]

☐ And ☐ Or

[?] < Back Next > Cancel

6. Select an (optional) sort order for the data. This is equivalent to using a **ORDER BY** clause in your SQL query. You can select up to three fields for sorting the information returned by the query. Click NEXT to continue.

Query Wizard - Sort Order

Specify how you want your data sorted.
If you don't want to sort the data, click Next.

Sort by

Name [Dropdown]

☒ Ascending
☐ Descending

Then by

[Dropdown]

☐ Ascending
☐ Descending

Then by

[Dropdown]

☐ Ascending
☐ Descending

[?] < Back Next > Cancel

7. Select the destination for your query. You can select to return the data Microsoft Excel, where you can choose a worksheet and cell

where the data will be inserted; you can continue to view the query and results within Microsoft Query, where you can edit the SQL query and further filter and sort the information returned; or you can create an OLAP Cube from the query, which can then be used directly within Microsoft Excel. Click **FINISH**.

The same process can be used to import data into a Word document, where the data will be inserted as a table. This can be used for mail merge purposes (where the field data is read from a Word table), or where you want to include data and reports within a report or other document.

26.1.4.6. Using Connector/ODBC with Crystal Reports

Crystal Reports can use an ODBC DSN to connect to a database from which you to extract data and information for reporting purposes.

Note

There is a known issue with certain versions of Crystal Reports where the application is unable to open and browse tables and fields through an ODBC connection. Before using Crystal Reports with MySQL, please ensure that you have update to the latest version, including any outstanding service packs and hotfixes. For more information on this issue, see the [Business Objects Knowledgebase](#) for more information.

For example, to create a simple crosstab report within Crystal Reports XI, you should follow these steps:

1. Create a DSN using the [Data Sources \(ODBC\)](#) tool. You can either specify a complete database, including username and password, or you can build a basic DSN and use Crystal Reports to set the username and password.

For the purposes of this example, a DSN that provides a connection to an instance of the MySQL Sakila sample database has been created.

2. Open Crystal Reports and create a new project, or open an existing reporting project into which you want to insert data from your MySQL data source.
3. Start the Cross-Tab Report Wizard, either by clicking on the option on the Start Page. Expand the **CREATE NEW CONNECTION** folder, then expand the **ODBC (RDO)** folder to obtain a list of ODBC data sources.

You will be asked to select a data source.

4. When you first expand the **ODBC (RDO)** folder you will be presented the Data Source Selection screen. From here you can select either a pre-configured DSN, open a file-based DSN or enter and manual connection string. For this example, the **SAKILA** DSN will be used.

If the DSN contains a username/password combination, or you want to use different authentication credentials, click **NEXT** to enter the username and password that you want to use. Otherwise, click **FINISH** to continue the data source selection wizard.

5. You will be returned the Cross-Tab Report Creation Wizard. You now need to select the database and tables that you want to include in your report. For our example, we will expand the selected Sakila database. Click the **city** table and use the > button to add the table to the report. Then repeat the action with the **country** table. Alternatively you can select multiple tables and add them to the report.

Finally, you can select the parent **SAKILA** resource and add of the tables to the report.

Once you have selected the tables you want to include, click **NEXT** to continue.

6. Crystal Reports will now read the table definitions and automatically identify the links between the tables. The identification of links between tables enables Crystal Reports to automatically lookup and summarize information based on all the tables in the database according to your query. If Crystal Reports is unable to perform the linking itself, you can manually create the links between fields in the tables you have selected.

Click NEXT to continue the process.

7. You can now select the columns and rows that you wish to include within the Cross-Tab report. Drag and drop or use the > buttons to add fields to each area of the report. In the example shown, we will report on cities, organized by country, incorporating a count of the number of cities within each country. If you want to browse the data, select a field and click the BROWSE DATA... button.

Click NEXT to create a graph of the results. Since we are not creating a graph from this data, click FINISH to generate the report.

8. The finished report will be shown, a sample of the output from the Sakila sample database is shown below.

		Total
Total		600
Afghanistan	Total	1
	Kabul	1
Algeria	Total	3
	Batna	1
	Bchar	1
	Skikda	1
American Samoa	Total	1
	Tafuna	1
Angola	Total	2
	Benguela	1
	Namibe	1
Anguilla	Total	1
	South Hill	1
Argentina	Total	13
	Almirante Brow	1

Once the ODBC connection has been opened within Crystal Reports, you can browse and add any fields within the available tables into your reports.

26.1.4.7. Connector/ODBC Programming

With a suitable ODBC Manager and the Connector/ODBC driver installed, any programming language or environment that can support ODBC should be able to connect to a MySQL database through Connector/ODBC.

This includes, but is certainly not limited to, Microsoft support languages (including Visual Basic, C# and interfaces such as ODBC.NET), Perl (through the DBI module, and the DBD::ODBC driver).

26.1.4.7.1. Using Connector/ODBC with Visual Basic Using ADO, DAO and RDO

This section contains simple examples of the use of MySQL ODBC 3.51 Driver with ADO, DAO and RDO.

26.1.4.7.1.1. ADO: `rs.addNew`, `rs.delete`, and `rs.update`

The following ADO (ActiveX Data Objects) example creates a table `my_ado` and demonstrates the use of `rs.addNew`, `rs.delete`, and `rs.update`.

```
Private Sub myodbc_ado_Click()

Dim conn As ADODB.Connection
Dim rs As ADODB.Recordset
Dim fld As ADODB.Field
Dim sql As String

'connect to MySQL server using MySQL ODBC 3.51 Driver
Set conn = New ADODB.Connection
conn.ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};" _
& "SERVER=localhost;" _
& " DATABASE=test;" _
& "UID=venu;PWD=venu; OPTION=3"

conn.Open

'create table
conn.Execute "DROP TABLE IF EXISTS my_ado"
conn.Execute "CREATE TABLE my_ado(id int not null primary key, name varchar(20)," _
& "txt text, dt date, tm time, ts timestamp)"

'direct insert
conn.Execute "INSERT INTO my_ado(id,name,txt) values(1,100,'venu')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(2,200,'MySQL')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(3,300,'Delete')"

Set rs = New ADODB.Recordset
rs.CursorLocation = adUseServer

'fetch the initial table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Initial my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close

'rs insert
rs.Open "select * from my_ado", conn, adOpenDynamic, adLockOptimistic
rs.AddNew
rs!Name = "Monty"
rs!txt = "Insert row"
rs.Update
rs.Close

'rs update
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-row"
rs.Update
rs.Close

'rs update second time..
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-second-time"
rs.Update
rs.Close

'rs delete
rs.Open "SELECT * FROM my_ado"
rs.MoveNext
rs.MoveNext
rs.Delete
rs.Close
```

```

'fetch the updated table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Updated my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close
conn.Close
End Sub

```

26.1.4.7.1.2. DAO: **rs.addNew**, **rs.update**, and Scrolling

The following DAO (Data Access Objects) example creates a table **my_dao** and demonstrates the use of **rs.addNew**, **rs.update**, and result set scrolling.

```

Private Sub myodbc_dao_Click()

Dim ws As Workspace
Dim conn As Connection
Dim queryDef As queryDef
Dim str As String

'connect to MySQL using MySQL ODBC 3.51 Driver
Set ws = DBEngine.CreateWorkspace("", "venu", "venu", dbUseODBC)
str = "odbc;DRIVER={MySQL ODBC 3.51 Driver};" _
& "SERVER=localhost;" _
& " DATABASE=test;" _
& "UID=venu;PWD=venu; OPTION=3"
Set conn = ws.OpenConnection("test", dbDriverNoPrompt, False, str)

'Create table my_dao
Set queryDef = conn.CreateQueryDef("", "drop table if exists my_dao")
queryDef.Execute

Set queryDef = conn.CreateQueryDef("", "create table my_dao(Id INT AUTO_INCREMENT PRIMARY KEY, " _
& "Ts TIMESTAMP(14) NOT NULL, Name varchar(20), Id2 INT)")
queryDef.Execute

'Insert new records using rs.addNew
Set rs = conn.OpenRecordset("my_dao")
Dim i As Integer

For i = 10 To 15
rs.AddNew
rs!Name = "insert record" & i
rs!Id2 = i
rs.Update
Next i
rs.Close

'rs update..
Set rs = conn.OpenRecordset("my_dao")
rs.Edit
rs!Name = "updated-string"
rs.Update
rs.Close

'fetch the table back...
Set rs = conn.OpenRecordset("my_dao", dbOpenDynamic)
str = "Results:"
rs.MoveFirst
While Not rs.EOF
str = " " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print "DATA:" & str
rs.MoveNext
Wend

'rs Scrolling
rs.MoveFirst
str = " FIRST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

rs.MoveLast
str = " LAST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

```

```

rs.MovePrevious
str = " LAST-1 ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

'free all resources
rs.Close
queryDef.Close
conn.Close
ws.Close

End Sub

```

26.1.4.7.1.3. RDO: `rs.addNew` and `rs.update`

The following RDO (Remote Data Objects) example creates a table `my_rdo` and demonstrates the use of `rs.addNew` and `rs.update`.

```

Dim rs As rdoResultset
Dim cn As New rdoConnection
Dim cl As rdoColumn
Dim SQL As String

'cn.Connect = "DSN=test;"
cn.Connect = "DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& " DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"

cn.CursorDriver = rdUseOdbc
cn.EstablishConnection rdDriverPrompt

'drop table my_rdo
SQL = "drop table if exists my_rdo"
cn.Execute SQL, rdExecDirect

'create table my_rdo
SQL = "create table my_rdo(id int, name varchar(20))"
cn.Execute SQL, rdExecDirect

'insert - direct
SQL = "insert into my_rdo values (100,'venu')"
cn.Execute SQL, rdExecDirect

SQL = "insert into my_rdo values (200,'MySQL')"
cn.Execute SQL, rdExecDirect

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 300
rs!Name = "Insert1"
rs.Update
rs.Close

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 400
rs!Name = "Insert 2"
rs.Update
rs.Close

'rs update
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.Edit
rs!id = 999
rs!Name = "updated"
rs.Update
rs.Close

'fetch back...
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
Do Until rs.EOF
For Each cl In rs.rdoColumns
Debug.Print cl.Value,
Next
rs.MoveNext
Debug.Print
Loop
Debug.Print "Row count="; rs.RowCount

```

```
'close
rs.Close
cn.Close

End Sub
```

26.1.4.7.2. Using Connector/ODBC with .NET

This section contains simple examples that demonstrate the use of Connector/ODBC drivers with ODBC.NET.

26.1.4.7.2.1. Using Connector/ODBC with ODBC.NET and C# (C sharp)

The following sample creates a table `my_odbc_net` and demonstrates its use in C#.

```
/**
 * @sample      : mycon.cs
 * @purpose     : Demo sample for ODBC.NET using Connector/ODBC
 * @author      : Venu, <myodbc@lists.mysql.com>
 *
 * (C) Copyright MySQL AB, 1995-2006
 *
 */

/* build command
 *
 * csc /t:exe
 *      /out:mycon.exe mycon.cs
 *      /r:Microsoft.Data.Odbc.dll
 */

using Console = System.Console;
using Microsoft.Data.Odbc;

namespace myodbc3
{
    class mycon
    {
        static void Main(string[] args)
        {
            try
            {
                //Connection string for MyODBC 2.50
                /*string MyConString = "DRIVER={MySQL};" +
                "SERVER=localhost;" +
                "DATABASE=test;" +
                "UID=venu;" +
                "PASSWORD=venu;" +
                "OPTION=3";
                */
                //Connection string for Connector/ODBC 3.51
                string MyConString = "DRIVER={MySQL ODBC 3.51 Driver};" +
                "SERVER=localhost;" +
                "DATABASE=test;" +
                "UID=venu;" +
                "PASSWORD=venu;" +
                "OPTION=3";

                //Connect to MySQL using Connector/ODBC
                OdbcConnection MyConnection = new OdbcConnection(MyConString);
                MyConnection.Open();

                Console.WriteLine("\n !!! success, connected successfully !!!\n");

                //Display connection information
                Console.WriteLine("Connection Information:");
                Console.WriteLine("\tConnection String:" +
                MyConnection.ConnectionString);
                Console.WriteLine("\tConnection Timeout:" +
                MyConnection.ConnectionTimeout);
                Console.WriteLine("\tDatabase:" +
                MyConnection.Database);
                Console.WriteLine("\tDataSource:" +
                MyConnection.DataSource);
                Console.WriteLine("\tDriver:" +
                MyConnection.Driver);
                Console.WriteLine("\tServerVersion:" +
                MyConnection.ServerVersion);

                //Create a sample table
                OdbcCommand MyCommand =
                new OdbcCommand("DROP TABLE IF EXISTS my_odbc_net",
                MyConnection);
                MyCommand.ExecuteNonQuery();
                MyCommand.CommandText =
```

```

"CREATE TABLE my_odbc_net(id int, name varchar(20), idb bigint)";
MyCommand.ExecuteNonQuery();

//Insert
MyCommand.CommandText =
"INSERT INTO my_odbc_net VALUES(10,'venu', 300)";
Console.WriteLine("INSERT, Total rows affected:" +
    MyCommand.ExecuteNonQuery());

//Insert
MyCommand.CommandText =
"INSERT INTO my_odbc_net VALUES(20,'mysql',400)";
Console.WriteLine("INSERT, Total rows affected:" +
    MyCommand.ExecuteNonQuery());

//Insert
MyCommand.CommandText =
"INSERT INTO my_odbc_net VALUES(20,'mysql',500)";
Console.WriteLine("INSERT, Total rows affected:" +
    MyCommand.ExecuteNonQuery());

//Update
MyCommand.CommandText =
"UPDATE my_odbc_net SET id=999 WHERE id=20";
Console.WriteLine("Update, Total rows affected:" +
    MyCommand.ExecuteNonQuery());

//COUNT(*)
MyCommand.CommandText =
"SELECT COUNT(*) as TRows FROM my_odbc_net";
Console.WriteLine("Total Rows:" +
    MyCommand.ExecuteScalar());

//Fetch
MyCommand.CommandText = "SELECT * FROM my_odbc_net";
OdbcDataReader MyDataReader;
MyDataReader = MyCommand.ExecuteReader();
while (MyDataReader.Read())
{
    if(string.Compare(MyConnection.Driver,"myodbc3.dll") == 0) {
        //Supported only by Connector/ODBC 3.51
        Console.WriteLine("Data:" + MyDataReader.GetInt32(0) + " " +
            MyDataReader.GetString(1) + " " +
            MyDataReader.GetInt64(2));
    }
    else {
        //BIGINTs not supported by Connector/ODBC
        Console.WriteLine("Data:" + MyDataReader.GetInt32(0) + " " +
            MyDataReader.GetString(1) + " " +
            MyDataReader.GetInt32(2));
    }
}

//Close all resources
MyDataReader.Close();
MyConnection.Close();
}
catch (OdbcException MyOdbcException) //Catch any ODBC exception ..
{
    for (int i=0; i < MyOdbcException.Errors.Count; i++)
    {
        Console.WriteLine("ERROR #" + i + "\n" +
            "Message: " +
            MyOdbcException.Errors[i].Message + "\n" +
            "Native: " +
            MyOdbcException.Errors[i].NativeError.ToString() + "\n" +
            "Source: " +
            MyOdbcException.Errors[i].Source + "\n" +
            "SQL: " +
            MyOdbcException.Errors[i].SQLState + "\n");
    }
}
}
}
}
}

```

26.1.4.7.2.2. Using Connector/ODBC with ODBC.NET and Visual Basic

The following sample creates a table `my_vb_net` and demonstrates the use in VB.

```

' @sample      : myvb.vb
' @purpose     : Demo sample for ODBC.NET using Connector/ODBC
' @author      : Venu, <myodbc@lists.mysql.com>
'
' (C) Copyright MySQL AB, 1995-2006
'

```

```

' build command
'
' vbc /target:exe
'      /out:myvb.exe
'      /r:Microsoft.Data.Odbc.dll
'      /r:System.dll
'      /r:System.Data.dll
'
Imports Microsoft.Data.Odbc
Imports System

Module myvb
    Sub Main()
        Try

            'Connector/ODBC 3.51 connection string
            Dim MyConString As String = "DRIVER={MySQL ODBC 3.51 Driver};" & _
                "SERVER=localhost;" & _
                "DATABASE=test;" & _
                "UID=venu;" & _
                "PASSWORD=venu;" & _
                "OPTION=3;"

            'Connection
            Dim MyConnection As New OdbcConnection(MyConString)
            MyConnection.Open()

            Console.WriteLine("Connection State:" & MyConnection.State.ToString)

            'Drop
            Console.WriteLine("Dropping table")
            Dim MyCommand As New OdbcCommand()
            MyCommand.Connection = MyConnection
            MyCommand.CommandText = "DROP TABLE IF EXISTS my_vb_net"
            MyCommand.ExecuteNonQuery()

            'Create
            Console.WriteLine("Creating...")
            MyCommand.CommandText = "CREATE TABLE my_vb_net(id int, name varchar(30))"
            MyCommand.ExecuteNonQuery()

'Catch program exception
Catch MyException As Exception
    Console.WriteLine(MyException.ToString)
End Try
End Sub

```

26.1.5. Connector/ODBC Reference

This section provides reference material for the Connector/ODBC API, showing supported functions and methods, supported MySQL column types and the corresponding native type in Connector/ODBC, and the error codes returned by Connector/ODBC when a fault occurs.

26.1.5.1. Connector/ODBC API Reference

This section summarizes ODBC routines, categorized by functionality.

For the complete ODBC API reference, please refer to the ODBC Programmer's Reference at http://msdn.microsoft.com/library/en-us/odbc/htm/odbcabout_this_manual.asp.

An application can call [SQLGetInfo](#) function to obtain conformance information about Connector/ODBC. To obtain information about support for a specific function in the driver, an application can call [SQLGetFunctions](#).

Note

For backward compatibility, the Connector/ODBC 3.51 driver supports all deprecated functions.

The following tables list Connector/ODBC API calls grouped by task:

Connecting to a data source:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLAllocHandle	No	Yes	ISO 92	Obtains an environment, connection, statement, or descriptor handle.
SQLConnect	Yes	Yes	ISO 92	Connects to a specific driver by data source name, user ID, and password.
SQLDriverConnect	Yes	Yes	ODBC	Connects to a specific driver by connection string or requests that the Driver Manager and driver display connection dialog boxes for the user.
SQLAllocEnv	Yes	Yes	Deprecated	Obtains an environment handle allocated from driver.
SQLAllocConnect	Yes	Yes	Deprecated	Obtains a connection handle

Obtaining information about a driver and data source:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLDataSources	No	No	ISO 92	Returns the list of available data sources, handled by the Driver Manager
SQLDrivers	No	No	ODBC	Returns the list of installed drivers and their attributes, handles by Driver Manager
SQLGetInfo	Yes	Yes	ISO 92	Returns information about a specific driver and data source.
SQLGetFunctions	Yes	Yes	ISO 92	Returns supported driver functions.
SQLGetTypeInfo	Yes	Yes	ISO 92	Returns information about supported data types.

Setting and retrieving driver attributes:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLSetConnectAttr	No	Yes	ISO 92	Sets a connection attribute.
SQLGetConnectAttr	No	Yes	ISO 92	Returns the value of a connection attribute.
SQLSetConnectOption	Yes	Yes	Deprecated	Sets a connection option
SQLGetConnectOption	Yes	Yes	Deprecated	Returns the value of a connection option
SQLSetEnvAttr	No	Yes	ISO 92	Sets an environment attribute.
SQLGetEnvAttr	No	Yes	ISO 92	Returns the value of an environment attribute.
SQLSetStmtAttr	No	Yes	ISO 92	Sets a statement attribute.
SQLGetStmtAttr	No	Yes	ISO 92	Returns the value of a statement attribute.
SQLSetStmtOption	Yes	Yes	Deprecated	Sets a statement option
SQLGetStmtOption	Yes	Yes	Deprecated	Returns the value of a statement option

Preparing SQL requests:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLAllocStmt	Yes	Yes	Deprecated	Allocates a statement handle
SQLPrepare	Yes	Yes	ISO 92	Prepares an SQL statement for later execution.
SQLBindParameter	Yes	Yes	ODBC	Assigns storage for a parameter in an SQL statement.
SQLGetCursorName	Yes	Yes	ISO 92	Returns the cursor name associated with a statement handle.
SQLSetCursorName	Yes	Yes	ISO 92	Specifies a cursor name.
SQLSetScrollOptions	Yes	Yes	ODBC	Sets options that control cursor behavior.

Submitting requests:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLExecute	Yes	Yes	ISO 92	Executes a prepared statement.
SQLExecDirect	Yes	Yes	ISO 92	Executes a statement
SQLNativeSql	Yes	Yes	ODBC	Returns the text of an SQL statement as translated by the driver.
SQLDescribeParam	Yes	Yes	ODBC	Returns the description for a specific parameter in a statement.
SQLNumParams	Yes	Yes	ISO 92	Returns the number of parameters in a statement.
SQLParamData	Yes	Yes	ISO 92	Used in conjunction with SQLPutData to supply parameter data at execution time. (Useful for long data values.)
SQLPutData	Yes	Yes	ISO 92	Sends part or all of a data value for a parameter. (Useful for long data values.)

Retrieving results and information about results:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		

SQLRowCount	Yes	Yes	ISO 92	Returns the number of rows affected by an insert, update, or delete request.
SQLNumResultCols	Yes	Yes	ISO 92	Returns the number of columns in the result set.
SQLDescribeCol	Yes	Yes	ISO 92	Describes a column in the result set.
SQLColAttribute	No	Yes	ISO 92	Describes attributes of a column in the result set.
SQLColAttributes	Yes	Yes	Deprecated	Describes attributes of a column in the result set.
SQLFetch	Yes	Yes	ISO 92	Returns multiple result rows.
SQLFetchScroll	No	Yes	ISO 92	Returns scrollable result rows.
SQLExtendedFetch	Yes	Yes	Deprecated	Returns scrollable result rows.
SQLSetPos	Yes	Yes	ODBC	Positions a cursor within a fetched block of data and allows an application to refresh data in the rowset or to update or delete data in the result set.
SQLBulkOperations	No	Yes	ODBC	Performs bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark.

Retrieving error or diagnostic information:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLError	Yes	Yes	Deprecated	Returns additional error or status information
SQLGetDiagField	Yes	Yes	ISO 92	Returns additional diagnostic information (a single field of the diagnostic data structure).
SQLGetDiagRec	Yes	Yes	ISO 92	Returns additional diagnostic information (multiple fields of the diagnostic data structure).

Obtaining information about the data source's system tables (catalog functions) item:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLColumnPrivileges	Yes	Yes	ODBC	Returns a list of columns and associated privileges for one or more tables.
SQLColumns	Yes	Yes	X/Open	Returns the list of column names in specified tables.
SQLForeignKeys	Yes	Yes	ODBC	Returns a list of column names that make up foreign keys, if they exist for a specified table.
SQLPrimaryKeys	Yes	Yes	ODBC	Returns the list of column names that make up the primary key for a table.
SQLSpecialColumns	Yes	Yes	X/Open	Returns information about the optimal set of columns that uniquely identifies a row in a specified table, or the columns that are automatically updated when any value in the row is updated by a transaction.
SQLStatistics	Yes	Yes	ISO 92	Returns statistics about a single table and the list of indexes associated with the table.
SQLTablePrivileges	Yes	Yes	ODBC	Returns a list of tables and the privileges associated with each table.
SQLTables	Yes	Yes	X/Open	Returns the list of table names stored in a specific data source.

Performing transactions:

	Connector/		

Function name	ODBC		Standard	Purpose
	2.50	3.51		
SQLTransact	Yes	Yes	Deprecated	Commits or rolls back a transaction
SQLEndTran	No	Yes	ISO 92	Commits or rolls back a transaction.

Terminating a statement:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLFreeStmt	Yes	Yes	ISO 92	Ends statement processing, discards pending results, and, optionally, frees all resources associated with the statement handle.
SQLCloseCursor	Yes	Yes	ISO 92	Closes a cursor that has been opened on a statement handle.
SQLCancel	Yes	Yes	ISO 92	Cancels an SQL statement.

Terminating a connection:

Function name	Connector/ ODBC		Standard	Purpose
	2.50	3.51		
SQLDisconnect	Yes	Yes	ISO 92	Closes the connection.
SQLFreeHandle	No	Yes	ISO 92	Releases an environment, connection, statement, or descriptor handle.
SQLFreeConnect	Yes	Yes	Deprecated	Releases connection handle
SQLFreeEnv	Yes	Yes	Deprecated	Releases an environment handle

26.1.5.2. Connector/ODBC Data Types

The following table illustrates how driver maps the server data types to default SQL and C data types:

Native Value	SQL Type	C Type
bit	SQL_BIT	SQL_C_BIT
tinyint	SQL_TINYINT	SQL_C_STINYINT
tinyint unsigned	SQL_TINYINT	SQL_C_UTINYINT
bigint	SQL_BIGINT	SQL_C_SBIGINT
bigint unsigned	SQL_BIGINT	SQL_C_UBIGINT
long varbinary	SQL_LONGVARBINARY	SQL_C_BINARY
blob	SQL_LONGVARBINARY	SQL_C_BINARY
longblob	SQL_LONGVARBINARY	SQL_C_BINARY
tinyblob	SQL_LONGVARBINARY	SQL_C_BINARY
mediumblob	SQL_LONGVARBINARY	SQL_C_BINARY
long varchar	SQL_LONGVARCHAR	SQL_C_CHAR
text	SQL_LONGVARCHAR	SQL_C_CHAR
mediumtext	SQL_LONGVARCHAR	SQL_C_CHAR
char	SQL_CHAR	SQL_C_CHAR
numeric	SQL_NUMERIC	SQL_C_CHAR
decimal	SQL_DECIMAL	SQL_C_CHAR
integer	SQL_INTEGER	SQL_C_SLONG

integer unsigned	SQL_INTEGER	SQL_C_ULONG
int	SQL_INTEGER	SQL_C_SLONG
int unsigned	SQL_INTEGER	SQL_C_ULONG
mediumint	SQL_INTEGER	SQL_C_SLONG
mediumint unsigned	SQL_INTEGER	SQL_C_ULONG
smallint	SQL_SMALLINT	SQL_C_SSHORT
smallint unsigned	SQL_SMALLINT	SQL_C_USHORT
real	SQL_FLOAT	SQL_C_DOUBLE
double	SQL_FLOAT	SQL_C_DOUBLE
float	SQL_REAL	SQL_C_FLOAT
double precision	SQL_DOUBLE	SQL_C_DOUBLE
date	SQL_DATE	SQL_C_DATE
time	SQL_TIME	SQL_C_TIME
year	SQL_SMALLINT	SQL_C_SHORT
datetime	SQL_TIMESTAMP	SQL_C_TIMESTAMP
timestamp	SQL_TIMESTAMP	SQL_C_TIMESTAMP
text	SQL_VARCHAR	SQL_C_CHAR
varchar	SQL_VARCHAR	SQL_C_CHAR
enum	SQL_VARCHAR	SQL_C_CHAR
set	SQL_VARCHAR	SQL_C_CHAR
bit	SQL_CHAR	SQL_C_CHAR
bool	SQL_CHAR	SQL_C_CHAR

26.1.5.3. Connector/ODBC Error Codes

The following tables lists the error codes returned by the driver apart from the server errors.

Native Code	SQLSTATE 2	SQLSTATE 3	Error Message
500	01000	01000	General warning
501	01004	01004	String data, right truncated
502	01S02	01S02	Option value changed
503	01S03	01S03	No rows updated/deleted
504	01S04	01S04	More than one row updated/deleted
505	01S06	01S06	Attempt to fetch before the result set returned the first row set
506	07001	07002	SQLBindParameter not used for all parameters
507	07005	07005	Prepared statement not a cursor-specification
508	07009	07009	Invalid descriptor index
509	08002	08002	Connection name in use
510	08003	08003	Connection does not exist
511	24000	24000	Invalid cursor state
512	25000	25000	Invalid transaction state
513	25S01	25S01	Transaction state unknown
514	34000	34000	Invalid cursor name
515	S1000	HY000	General driver defined error
516	S1001	HY001	Memory allocation error

517	S1002	HY002	Invalid column number
518	S1003	HY003	Invalid application buffer type
519	S1004	HY004	Invalid SQL data type
520	S1009	HY009	Invalid use of null pointer
521	S1010	HY010	Function sequence error
522	S1011	HY011	Attribute can not be set now
523	S1012	HY012	Invalid transaction operation code
524	S1013	HY013	Memory management error
525	S1015	HY015	No cursor name available
526	S1024	HY024	Invalid attribute value
527	S1090	HY090	Invalid string or buffer length
528	S1091	HY091	Invalid descriptor field identifier
529	S1092	HY092	Invalid attribute/option identifier
530	S1093	HY093	Invalid parameter number
531	S1095	HY095	Function type out of range
532	S1106	HY106	Fetch type out of range
533	S1117	HY117	Row value out of range
534	S1109	HY109	Invalid cursor position
535	S1C00	HYC00	Optional feature not implemented
0	21S01	21S01	Column count does not match value count
0	23000	23000	Integrity constraint violation
0	42000	42000	Syntax error or access violation
0	42S02	42S02	Base table or view not found
0	42S12	42S12	Index not found
0	42S21	42S21	Column already exists
0	42S22	42S22	Column not found
0	08S01	08S01	Communication link failure

26.1.6. Connector/ODBC Notes and Tips

Here are some common notes and tips for using Connector/ODBC within different environments, applications and tools. The notes provided here are based on the experiences of Connector/ODBC developers and users.

26.1.6.1. Connector/ODBC General Functionality

This section provides help with common queries and areas of functionality in MySQL and how to use them with Connector/ODBC.

26.1.6.1.1. Obtaining Auto-Increment Values

Obtaining the value of column that uses [AUTO_INCREMENT](#) after an [INSERT](#) statement can be achieved in a number of different ways. To obtain the value immediately after an [INSERT](#), use a [SELECT](#) query with the [LAST_INSERT_ID\(\)](#) function.

For example, using Connector/ODBC you would execute two separate statements, the [INSERT](#) statement and the [SELECT](#) query to obtain the auto-increment value.

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
SELECT LAST_INSERT_ID();
```

If you do not require the value within your application, but do require the value as part of another [INSERT](#), the entire process can be handled by executing the following statements:

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');  
INSERT INTO tbl2 (id,text) VALUES(LAST_INSERT_ID(),'text');
```

Certain ODBC applications (including Delphi and Access) may have trouble obtaining the auto-increment value using the previous examples. In this case, try the following statement as an alternative:

```
SELECT * FROM tbl WHERE auto IS NULL;
```

See [Section 25.2.14.3, “How to Get the Unique ID for the Last Inserted Row”](#).

26.1.6.1.2. Dynamic Cursor Support

Support for the [dynamic cursor](#) is provided in Connector/ODBC 3.51, but dynamic cursors are not enabled by default. You can enable this function within Windows by selecting the [Enable Dynamic Cursor](#) checkbox within the ODBC Data Source Administrator.

On other platforms, you can enable the dynamic cursor by adding [32](#) to the [OPTION](#) value when creating the DSN.

26.1.6.1.3. Connector/ODBC Performance

The Connector/ODBC driver has been optimized to provide very fast performance. If you experience problems with the performance of Connector/ODBC, or notice a large amount of disk activity for simple queries, there are a number of aspects you should check:

- Ensure that [ODBC Tracing](#) is not enabled. With tracing enabled, a lot of information is recorded in the tracing file by the ODBC Manager. You can check, and disable, tracing within Windows using the TRACING panel of the ODBC Data Source Administrator. Within Mac OS X, check the TRACING panel of ODBC Administrator. See [Section 26.1.3.8, “Getting an ODBC Trace File”](#).
- Make sure you are using the standard version of the driver, and not the debug version. The debug version includes additional checks and reporting measures.
- Disable the Connector/ODBC driver trace and query logs. These options are enabled for each DSN, so make sure to examine only the DSN that you are using in your application. Within Windows, you can disable the Connector/ODBC and query logs by modifying the DSN configuration. Within Mac OS X and Unix, ensure that the driver trace (option value 4) and query logging (option value 524288) are not enabled.

26.1.6.1.4. Setting ODBC Query Timeout in Windows

For more information on how to set the query timeout on Microsoft Windows when executing queries through an ODBC connection, read the Microsoft knowledgebase document at <http://support.microsoft.com/default.aspx?scid=kb%3Ben-us%3B153756>.

26.1.6.2. Connector/ODBC Application Specific Tips

Most programs should work with Connector/ODBC, but for each of those listed here, there are specific notes and tips to improve or enhance the way you work with Connector/ODBC and these applications.

With all applications you should ensure that you are using the latest Connector/ODBC drivers, ODBC Manager and any supporting libraries and interfaces used by your application. For example, on Windows, using the latest version of Microsoft Data Access Components (MDAC) will improve the compatibility with ODBC in general, and with the Connector/ODBC driver.

26.1.6.2.1. Using Connector/ODBC with Microsoft Applications

The majority of Microsoft applications have been tested with Connector/ODBC, including Microsoft Office, Microsoft Access and the various programming languages supported within ASP and Microsoft Visual Studio.

26.1.6.2.1.1. Microsoft Access

To improve the integration between Microsoft Access and MySQL through Connector/ODBC:

- For all versions of Access, you should enable the Connector/ODBC [Return matching rows](#) option. For Access 2.0, you should additionally enable the [Simulate ODBC 1.0](#) option.

- You should have a **TIMESTAMP** column in all tables that you want to be able to update. For maximum portability, don't use a length specification in the column declaration (which is unsupported within MySQL in versions earlier than 4.1).
- You should have a primary key in each MySQL table you want to use with Access. If not, new or updated rows may show up as **#DELETED#**.
- Use only **DOUBLE** float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as **#DELETED#** or that you can't find or update rows.
- If you are using Connector/ODBC to link to a table that has a **BIGINT** column, the results are displayed as **#DELETED#**. The work around solution is:
 - Have one more dummy column with **TIMESTAMP** as the data type.
 - Select the **Change BIGINT columns to INT** option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records may still display as **#DELETED#**, but newly added/updated records are displayed properly.

- If you still get the error **Another user has changed your data** after adding a **TIMESTAMP** column, the following trick may help you:

Don't use a **table** data sheet view. Instead, create a form with the fields you want, and use that **form** data sheet view. You should set the **DefaultValue** property for the **TIMESTAMP** column to **NOW()**. It may be a good idea to hide the **TIMESTAMP** column from view so your users are not confused.
- In some cases, Access may generate SQL statements that MySQL can't understand. You can fix this by selecting **"Query|SQLSpecific|Pass-Through"** from the Access menu.
- On Windows NT, Access reports **BLOB** columns as **OLE OBJECTS**. If you want to have **MEMO** columns instead, you should change **BLOB** columns to **TEXT** with **ALTER TABLE**.
- Access can't always handle the MySQL **DATE** column properly. If you have a problem with these, change the columns to **DATE - TIME**.
- If you have in Access a column defined as **BYTE**, Access tries to export this as **TINYINT** instead of **TINYINT UNSIGNED**. This gives you problems if you have values larger than 127 in the column.
- If you have very large (long) tables in Access, it might take a very long time to open them. Or you might run low on virtual memory and eventually get an **ODBC Query Failed** error and the table cannot open. To deal with this, select the following options:
 - Return Matching Rows (2)
 - Allow BIG Results (8).

These add up to a value of 10 (**OPTION=10**).

Some external articles and tips that may be useful when using Access, ODBC and Connector/ODBC:

- Read [How to Trap ODBC Login Error Messages in Access](#)
- Optimizing Access ODBC Applications
 - [Optimizing for Client/Server Performance](#)
 - [Tips for Converting Applications to Using ODBCDirect](#)
 - [Tips for Optimizing Queries on Attached SQL Tables](#)
- For a list of tools that can be used with Access and ODBC data sources, refer to [converters](#) section for list of available tools.

MySQL Enterprise subscribers will find more information about using ODBC with Access in Knowledge Base articles such as [Use MySQL-Specific Syntax with Microsoft Access](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

26.1.6.2.1.2. Microsoft Excel and Column Types

If you have problems importing data into Microsoft Excel, particularly numerical, date, and time values, this is probably because of a bug in Excel, where the column type of the source data is used to determine the data type when that data is inserted into a cell within the worksheet. The result is that Excel incorrectly identifies the content and this affects both the display format and the data when it is used within calculations.

To address this issue, use the `CONCAT()` function in your queries. The use of `CONCAT()` forces Excel to treat the value as a string, which Excel will then parse and usually correctly identify the embedded information.

However, even with this option, some data may be incorrectly formatted, even though the source data remains unchanged. Use the `Format Cells` option within Excel to change the format of the displayed information.

26.1.6.2.1.3. Microsoft Visual Basic

To be able to update a table, you must define a primary key for the table.

Visual Basic with ADO can't handle big integers. This means that some queries like `SHOW PROCESSLIST` do not work properly. The fix is to use `OPTION=16384` in the ODBC connect string or to select the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen. You may also want to select the `Return matching rows` option.

MySQL Enterprise

MySQL Enterprise subscribers can find a discussion about using VBA in the Knowledge Base article, [MySQL-Specific Syntax with VBA](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

26.1.6.2.1.4. Microsoft Visual InterDev

If you have a `BIGINT` in your result, you may get the error `[Microsoft][ODBC Driver Manager] Driver does not support this parameter`. Try selecting the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen.

26.1.6.2.1.5. Visual Objects

You should select the `Don't optimize column widths` option.

26.1.6.2.1.6. Microsoft ADO

When you are coding with the ADO API and Connector/ODBC, you need to pay attention to some default properties that aren't supported by the MySQL server. For example, using the `CursorLocation Property` as `adUseServer` returns a result of `-1` for the `RecordCount Property`. To have the right value, you need to set this property to `adUseClient`, as shown in the VB code here:

```
Dim myconn As New ADODB.Connection
Dim myrs As New Recordset
Dim mySQL As String
Dim myrows As Long

myconn.Open "DSN=MyODBCsample"
mySQL = "SELECT * from user"
myrs.Source = mySQL
Set myrs.ActiveConnection = myconn
myrs.CursorLocation = adUseClient
myrs.Open
myrows = myrs.RecordCount

myrs.Close
myconn.Close
```

Another workaround is to use a `SELECT COUNT(*)` statement for a similar query to get the correct row count.

To find the number of rows affected by a specific SQL statement in ADO, use the `RecordsAffected` property in the ADO execute method. For more information on the usage of execute method, refer to <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/html/mdmthcnexecute.asp>.

For information, see [ActiveX Data Objects\(ADO\) Frequently Asked Questions](#).

26.1.6.2.1.7. Using Connector/ODBC with Active Server Pages (ASP)

You should select the [Return matching rows](#) option in the DSN.

For more information about how to access MySQL via ASP using Connector/ODBC, refer to the following articles:

- [Using MyODBC To Access Your MySQL Database Via ASP](#)
- [ASP and MySQL at DWAM.NT](#)

A Frequently Asked Questions list for ASP can be found at <http://support.microsoft.com/default.aspx?scid=/Support/ActiveServer/faq/data/adofaq.asp>.

26.1.6.2.1.8. Using Connector/ODBC with Visual Basic (ADO, DAO and RDO) and ASP

Some articles that may help with Visual Basic and ASP:

- [MySQL BLOB columns and Visual Basic 6](#) by Mike Hillyer (<mike@openwin.org>).
- [How to map Visual basic data type to MySQL types](#) by Mike Hillyer (<mike@openwin.org>).

26.1.6.2.2. Using Connector/ODBC with Borland Applications

With all Borland applications where the Borland Database Engine (BDE) is used, follow these steps to improve compatibility:

- Update to BDE 3.2 or newer.
- Enable the [Don't optimize column widths](#) option in the DSN.
- Enabled the [Return matching rows](#) option in the DSN.

26.1.6.2.2.1. Using Connector/ODBC with Borland Builder 4

When you start a query, you can use the [Active](#) property or the [Open](#) method. Note that [Active](#) starts by automatically issuing a `SELECT * FROM ...` query. That may not be a good thing if your tables are large.

26.1.6.2.2.2. Using Connector/ODBC with Delphi

Also, here is some potentially useful Delphi code that sets up both an ODBC entry and a BDE entry for Connector/ODBC. The BDE entry requires a BDE Alias Editor that is free at a Delphi Super Page near you. (Thanks to Bryan Brunton <bryan@flesherfab.com> for this):

```
fReg:= TRegistry.Create;
fReg.OpenKey('\Software\ODBC\ODBC.INI\DocumentsFab', True);
fReg.WriteString('Database', 'Documents');
fReg.WriteString('Description', '');
fReg.WriteString('Driver', 'C:\WINNT\System32\myodbc.dll');
fReg.WriteString('Flag', '1');
fReg.WriteString('Password', '');
fReg.WriteString('Port', '');
fReg.WriteString('Server', 'xmark');
fReg.WriteString('User', 'winuser');
fReg.OpenKey('\Software\ODBC\ODBC.INI\ODBC Data Sources', True);
fReg.WriteString('DocumentsFab', 'MySQL');
fReg.CloseKey;
fReg.Free;

Memo1.Lines.Add('DATABASE NAME=');
Memo1.Lines.Add('USER NAME=');
Memo1.Lines.Add('ODBC DSN=DocumentsFab');
Memo1.Lines.Add('OPEN MODE=READ/WRITE');
Memo1.Lines.Add('BATCH COUNT=200');
Memo1.Lines.Add('LANGDRIVER=');
Memo1.Lines.Add('MAX ROWS=-1');
Memo1.Lines.Add('SCHEMA CACHE DIR=');
Memo1.Lines.Add('SCHEMA CACHE SIZE=8');
Memo1.Lines.Add('SCHEMA CACHE TIME=-1');
```

```
Memo1.Lines.Add('SQLPASSTHRU MODE=SHARED AUTOCOMMIT');
Memo1.Lines.Add('SQLQRYMODE=');
Memo1.Lines.Add('ENABLE SCHEMA CACHE=FALSE');
Memo1.Lines.Add('ENABLE BCD=FALSE');
Memo1.Lines.Add('ROWSET SIZE=20');
Memo1.Lines.Add('BLOBS TO CACHE=64');
Memo1.Lines.Add('BLOB SIZE=32');
AliasEditor.Add('DocumentsFab', 'MySQL', Memo1.Lines);
```

26.1.6.2.2.3. Using Connector/ODBC with C++ Builder

Tested with BDE 3.0. The only known problem is that when the table schema changes, query fields are not updated. BDE, however, does not seem to recognize primary keys, only the index named **PRIMARY**, although this has not been a problem.

26.1.6.2.3. Using Connector/ODBC with ColdFusion

The following information is taken from the ColdFusion documentation:

Use the following information to configure ColdFusion Server for Linux to use the **unixODBC** driver with Connector/ODBC for MySQL data sources. Allaire has verified that MyODBC 2.50.26 works with MySQL 3.22.27 and ColdFusion for Linux. (Any newer version should also work.) You can download Connector/ODBC at <http://dev.mysql.com/downloads/connector/odbc/>.

ColdFusion version 4.5.1 allows you to use the ColdFusion Administrator to add the MySQL data source. However, the driver is not included with ColdFusion version 4.5.1. Before the MySQL driver appears in the ODBC data sources drop-down list, you must build and copy the Connector/ODBC driver to `/opt/coldfusion/lib/libmyodbc.so`.

The Contrib directory contains the program `mysdn-xxx.zip` which allows you to build and remove the DSN registry file for the Connector/ODBC driver on ColdFusion applications.

For more information and guides on using ColdFusion and Connector/ODBC, see the following external sites:

- [Troubleshooting Data Sources and Database Connectivity for Unix Platforms](#).

26.1.6.2.4. Using Connector/ODBC with OpenOffice

Open Office (<http://www.openoffice.org>) [How-to: MySQL + OpenOffice](#). [How-to: OpenOffice + MyODBC + unixODBC](#).

26.1.6.2.5. Using Connector/ODBC with Sambar Server

Sambar Server (<http://www.sambarserver.info>) [How-to: MyODBC + SambarServer + MySQL](#).

26.1.6.2.6. Using Connector/ODBC with Pervasive Software DataJunction

You have to change it to output **VARCHAR** rather than **ENUM**, as it exports the latter in a manner that causes MySQL problems.

26.1.6.2.7. Using Connector/ODBC with SunSystems Vision

You should select the **Return matching rows** option.

26.1.6.3. Connector/ODBC Errors and Resolutions (FAQ)

The following section details some common errors and their suggested fix or alternative solution. If you are still experiencing problems, use the Connector/ODBC mailing list; see [Section 26.1.7.1, “Connector/ODBC Community Support”](#).

Many problems can be resolved by upgrading your Connector/ODBC drivers to the latest available release. On Windows, you should also make sure that you have the latest versions of the Microsoft Data Access Components (MDAC) installed.

Questions

- [27.1.6.3.1](#): Are MyODBC 2.50 applications compatible with Connector/ODBC 3.51?
- [27.1.6.3.2](#): I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation com-

pleted successfully, but the Connector/ODBC driver does not appear in [ODBC Data Source Administrator](#).

- [27.1.6.3.3](#): When connecting or using the TEST button in [ODBC Data Source Administrator](#) I get error 10061 (Cannot connect to server)
- [27.1.6.3.4](#): The following error is reported when using transactions: [Transactions are not enabled](#)
- [27.1.6.3.5](#): The following error is reported when I submit a query: [Cursor not found](#)
- [27.1.6.3.6](#): Access reports records as [#DELETED#](#) when inserting or updating records in linked tables.
- [27.1.6.3.7](#): How do I handle Write Conflicts or Row Location errors?
- [27.1.6.3.8](#): Exporting data from Access 97 to MySQL reports a [Syntax Error](#).
- [27.1.6.3.9](#): Exporting data from Microsoft DTS to MySQL reports a [Syntax Error](#).
- [27.1.6.3.10](#): Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the SQL_NO_DATA exception.
- [27.1.6.3.11](#): Using [SELECT COUNT\(*\) FROM tbl_name](#) within Visual Basic and ASP returns an error.
- [27.1.6.3.12](#): Using the [AppendChunk\(\)](#) or [GetChunk\(\)](#) ADO methods, the [Multiple-step operation generated errors. Check each status value](#) error is returned.
- [27.1.6.3.13](#): Access Returns [Another user had modified the record that you have modified](#) while editing records on a Linked Table.
- [27.1.6.3.14](#): When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.
- [27.1.6.3.15](#): Applications in the Microsoft Office suite are unable to update tables that have [DATE](#) or [TIMESTAMP](#) columns.
- [27.1.6.3.16](#): When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error [1044 Access denied for user 'xxx'@'%' to database 'information_schema'](#) is returned.
- [27.1.6.3.17](#): When calling [SQLTables](#), the error [S1T00](#) is returned, but I cannot find this in the list of error numbers for Connector/ODBC.
- [27.1.6.3.18](#): When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.
- [27.1.6.3.19](#): When I try to use batched statements, the execution of the batched statements fails.

Questions and Answers

27.1.6.3.1: Are MyODBC 2.50 applications compatible with Connector/ODBC 3.51?

Applications based on MyODBC 2.50 should work fine with Connector/ODBC 3.51 and later versions. If you find something is not working with the latest version of Connector/ODBC which previously worked under an earlier version, please file a bug report. See [Section 26.1.7.2, “How to Report Connector/ODBC Problems or Bugs”](#).

27.1.6.3.2: I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the Connector/ODBC driver does not appear in [ODBC Data Source Administrator](#).

This is not a bug, but is related to the way Windows x64 editions operate with the ODBC driver. On Windows x64 editions, the Connector/ODBC driver is installed in the [%SystemRoot%\SysWOW64](#) folder. However, the default [ODBC Data Source Administrator](#) that is available through the [Administrative Tools](#) or [Control Panel](#) in Windows x64 Editions is located in the [%SystemRoot%\system32](#) folder, and only searches this folder for ODBC drivers.

On Windows x64 editions, you should use the ODBC administration tool located at [%SystemRoot%\SysWOW64\odbcad32.exe](#), this will correctly locate the installed Connector/ODBC drivers and enable you to create a Connector/ODBC DSN.

This issue was originally reported as [Bug#20301](#).

27.1.6.3.3: When connecting or using the TEST button in [ODBC Data Source Administrator](#) I get error 10061 (Cannot

connect to server)

This error can be raised by a number of different issues, including server problems, network problems, and firewall and port blocking problems. For more information, see [Section B.1.2.2, “Can't connect to \[local\] MySQL server”](#).

27.1.6.3.4: The following error is reported when using transactions: Transactions are not enabled

This error indicates that you are trying to use transactions with a MySQL table that does not support transactions. Transactions are supported within MySQL when using the [InnoDB](#) database engine. In versions of MySQL before Mysql 5.1 you may also use the [BDB](#) engine.

You should check the following before continuing:

- Verify that your MySQL server supports a transactional database engine. Use [SHOW ENGINES](#) to obtain a list of the available engine types.
- Verify that the tables you are updating use a transaction database engine.
- Ensure that you have not enabled the [disable transactions](#) option in your DSN.

27.1.6.3.5: The following error is reported when I submit a query: Cursor not found

This occurs because the application is using the old MyODBC 2.50 version, and it did not set the cursor name explicitly through SQL-SetCursorName. The fix is to upgrade to Connector/ODBC 3.51 version.

27.1.6.3.6: Access reports records as #DELETED# when inserting or updating records in linked tables.

If the inserted or updated records are shown as [#DELETED#](#) in the access, then:

- If you are using Access 2000, you should get and install the newest (version 2.6 or higher) Microsoft MDAC ([Microsoft Data Access Components](#)) from <http://www.microsoft.com/data/>. This fixes a bug in Access that when you export data to MySQL, the table and column names aren't specified. Another way to work around this bug is to upgrade to MyODBC 2.50.33 or higher and MySQL 3.23.x or higher, which together provide a workaround for the problem.

You should also get and apply the Microsoft Jet 4.0 Service Pack 5 (SP5) which can be found at <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q239114>. This fixes some cases where columns are marked as [#DELETED#](#) in Access.

Note

If you are using MySQL 3.22, you must apply the MDAC patch and use MyODBC 2.50.32 or 2.50.34 and up to work around this problem.

- For all versions of Access, you should enable the Connector/ODBC [Return matching rows](#) option. For Access 2.0, you should additionally enable the [Simulate ODBC 1.0](#) option.
- You should have a timestamp in all tables that you want to be able to update.
- You should have a primary key in the table. If not, new or updated rows may show up as [#DELETED#](#).
- Use only [DOUBLE](#) float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as [#DELETED#](#) or that you can't find or update rows.
- If you are using Connector/ODBC to link to a table that has a [BIGINT](#) column, the results are displayed as [#DELETED](#). The work around solution is:
 - Have one more dummy column with [TIMESTAMP](#) as the data type.
 - Select the [Change BIGINT columns to INT](#) option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records still display as [#DELETED#](#), but newly added/updated records are displayed properly.

27.1.6.3.7: How do I handle Write Conflicts or Row Location errors?

If you see the following errors, select the **Return Matching Rows** option in the DSN configuration dialog, or specify **OPTION=2**, as the connection parameter:

```
Write Conflict. Another user has changed your data.  
Row cannot be located for updating. Some values may have been changed  
since it was last read.
```

27.1.6.3.8: Exporting data from Access 97 to MySQL reports a Syntax Error.

This error is specific to Access 97 and versions of Connector/ODBC earlier than 3.51.02. Update to the latest version of the Connector/ODBC driver to resolve this problem.

27.1.6.3.9: Exporting data from Microsoft DTS to MySQL reports a Syntax Error.

This error occurs only with MySQL tables using the **TEXT** or **VARCHAR** data types. You can fix this error by upgrading your Connector/ODBC driver to version 3.51.02 or higher.

27.1.6.3.10: Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the SQL_NO_DATA exception.

You can get the patch that addresses this problem from <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q319243>.

27.1.6.3.11: Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.

This error occurs because the `COUNT(*)` expression is returning a **BIGINT**, and ADO can't make sense of a number this big. Select the **Change BIGINT columns to INT** option (option value 16384).

27.1.6.3.12: Using the `AppendChunk()` or `GetChunk()` ADO methods, the Multiple-step operation generated errors. Check each status value error is returned.

The `GetChunk()` and `AppendChunk()` methods from ADO doesn't work as expected when the cursor location is specified as **adUseServer**. On the other hand, you can overcome this error by using **adUseClient**.

A simple example can be found from http://www.dwam.net/iishelp/ado/docs/adomth02_4.htm

27.1.6.3.13: Access Returns `Another user had modified the record that you have modified` while editing records on a Linked Table.

In most cases, this can be solved by doing one of the following things:

- Add a primary key for the table if one doesn't exist.
- Add a timestamp column if one doesn't exist.
- Only use double-precision float fields. Some programs may fail when they compare single-precision floats.

If these strategies don't help, you should start by making a log file from the ODBC manager (the log you get when requesting logs from ODBCADMIN) and a Connector/ODBC log to help you figure out why things go wrong. For instructions, see [Section 26.1.3.8](#), "Getting an ODBC Trace File".

27.1.6.3.14: When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.

Connector/ODBC 3.51 under Unix/Linux is not compatible with direct application linking. You must use a driver manager, such as iODBC or unixODBC to connect to an ODBC source.

27.1.6.3.15: Applications in the Microsoft Office suite are unable to update tables that have **DATE or **TIMESTAMP** columns.**

This is a known issue with Connector/ODBC. You must ensure that the field has a default value (rather than **NULL** and that the default value is non-zero (i.e. the default value is not `0000-00-00 00:00:00`).

27.1.6.3.16: When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error `1044 Access denied for user 'xxx'@'%' to database 'information_schema'` is returned.

Connector/ODBC 5.x is designed to work with MySQL 5.0 or later, taking advantage of the [INFORMATION_SCHEMA](#) database to determine data definition information. Support for MySQL 4.1 is planned for the final release.

27.1.6.3.17: When calling [SQLTables](#), the error [S1T00](#) is returned, but I cannot find this in the list of error numbers for Connector/ODBC.

The [S1T00](#) error indicates that a general timeout has occurred within the ODBC system and is not a MySQL error. Typically it indicates that the connection you are using is stale, the server is too busy to accept your request or that the server has gone away.

27.1.6.3.18: When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.

There is a known issue with a specific version of the [msjet40.dll](#) that exhibits this issue. The version affected is 4.0.9025.0. Reverting to an older version will enable you to create the links. If you have recently updated your version, check your [WINDOWS](#) directory for the older version of the file and copy it to the drivers directory.

27.1.6.3.19: When I try to use batched statements, the execution of the batched statements fails.

Batched statement support was added in 3.51.18. Support for batched statements is not enabled by default. You must enable option [FLAG_MULTI_STATEMENTS](#), value 67108864, or select the **ALLOW MULTIPLE STATEMENTS** flag within a GUI configuration.

26.1.7. Connector/ODBC Support

There are many different places where you can get support for using Connector/ODBC. You should always try the Connector/ODBC Mailing List or Connector/ODBC Forum. See [Section 26.1.7.1, “Connector/ODBC Community Support”](#), for help before reporting a specific bug or issue to MySQL.

26.1.7.1. Connector/ODBC Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/ODBC-related issues, you can get help from experienced users by using the [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com) mailing list. Archives are available online at <http://lists.mysql.com/myodbc>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [ODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, “MySQL Community Support at the MySQL Forums”](#).

26.1.7.2. How to Report Connector/ODBC Problems or Bugs

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) (the log you get when requesting logs from [ODBC ADMIN](#)) and Connector/ODBC. The procedure for doing this is described in [Section 26.1.3.8, “Getting an ODBC Trace File”](#).

Check the Connector/ODBC trace file to find out what could be wrong. You should be able to determine what statements were issued by searching for the string [>mysql_real_query](#) in the [myodbc.log](#) file.

You should also try issuing the statements from the [mysql](#) client program or from [admdemo](#). This helps you determine whether the error is in Connector/ODBC or MySQL.

If you find out something is wrong, please only send the relevant rows (maximum 40 rows) to the [myodbc](#) mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). Please never send the whole Connector/ODBC or ODBC log file!

You should ideally include the following information with the email:

- Operating system and version
- Connector/ODBC version
- ODBC Driver Manager type and version
- MySQL server version

- ODBC trace from Driver Manager
- Connector/ODBC log file from Connector/ODBC driver
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem!

Also, before posting the bug, check the MyODBC mailing list archive at <http://lists.mysql.com/myodbc>.

If you are unable to find out what's wrong, the last option is to create an archive in [tar](#) or Zip format that contains a Connector/ODBC trace file, the ODBC log file, and a [README](#) file that explains the problem. You can send this to <ftp://ftp.mysql.com/pub/mysql/upload/>. Only MySQL engineers have access to the files you upload, and we are very discreet with the data.

If you can create a program that also demonstrates the problem, please include it in the archive as well.

If the program works with another SQL server, you should include an ODBC log file where you perform exactly the same SQL statements so that we can compare the results between the two systems.

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

26.1.7.3. How to Submit a Connector/ODBC Patch

You can send a patch or suggest a better solution for any existing code or problems by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

26.1.7.4. Connector/ODBC Change History

The Connector/ODBC Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.2, “MySQL Connector/ODBC \(MyODBC\) Change History”](#).

26.1.7.5. Credits

These are the developers that have worked on the Connector/ODBC and Connector/ODBC 3.51 Drivers from MySQL AB.

- Michael (Monty) Widenius
- Venu Anuganti

26.2. MySQL Connector/NET

Connector/NET enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. Connector/NET is a fully managed ADO.NET driver written in 100% pure C#.

Connector/NET includes full support for:

- MySQL 5.0 features (such as stored procedures)
- MySQL 4.1 features (server-side prepared statements, Unicode, and shared memory access, and so forth)
- Large-packet support for sending and receiving rows and BLOBs up to 2 gigabytes in size.
- Protocol compression which allows for compressing the data stream between the client and server.
- Support for connecting using TCP/IP sockets, named pipes, or shared memory on Windows.
- Support for connecting using TCP/IP sockets or Unix sockets on Unix.

- Support for the Open Source Mono framework developed by Novell.
- Fully managed, does not utilize the MySQL client library.

This document is intended as a user's guide to Connector/NET and includes a full syntax reference. Syntax information is also included within the [Documentation.chm](#) file included with the Connector/NET distribution.

If you are using MySQL 5.0 or later, and Visual Studio as your development environment, you may want also want to use the MySQL Visual Studio Plugin. The plugin acts as a DDEX (Data Designer Extensibility) provider, enabling you to use the data design tools within Visual Studio to manipulate the schema and objects within a MySQL database. For more information, see [Section 26.3, “MySQL Visual Studio Plugin”](#).

Note

Connector/NET 5.1.2 and later include the Visual Studio Plugin by default.

26.2.1. Connector/NET Versions

There are currently three versions of Connector/NET available:

- Connector/NET 1.0 includes support for MySQL 4.0, and MySQL 5.0 features, and full compatibility with the ADO.NET driver interface.

Connector/NET 5.0 includes support for MySQL 4.0, MySQL 4.1, MySQL 5.0 and MySQL 5.1 features. Connector/NET 5.0 also includes full support for the ADO.Net 2.0 interfaces and subclasses, includes support for the usage advisor and performance monitor (PerfMon) hooks.

Connector/NET 5.1 includes support for MySQL 4.0, MySQL 5.0, MySQL 5.1 and MySQL 6.0 (Falcon Preview) features. Connector/NET 5.1 also includes support for a new membership/role provider, Compact Framework 2.0, a new stored procedure parser and improvements to [GetSchema](#). Connector/NET 5.1 also includes the Visual Studio Plugin as a standard installable component.

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

26.2.2. Connector/NET Installation

Connector/NET runs on any platform that supports the .NET framework. The .NET framework is primarily supported on recent versions of Microsoft Windows, and is supported on Linux through the Open Source Mono framework (see <http://www.mono-project.com>).

Connector/NET is available for download from <http://dev.mysql.com/downloads/connector/net/1.0.html>.

26.2.2.1. Installing Connector/NET on Windows

On Windows, installation is supported either through a binary installation process or by downloading a Zip file with the Connector/NET components.

Before installing, you should ensure that your system is up to date, including installing the latest version of the .NET Framework.

26.2.2.1.1. Installing Connector/NET using the Installer

Using the installer is the most straightforward method of installing Connector/NET on Windows and the installed components include the source code, test code and full reference documentation.

Connector/NET is installed through the use of a Windows Installer ([.msi](#)) installation package, which can be used to install Connector/NET on all Windows operating systems. The MSI package is contained within a ZIP archive named [mysql-connector-net-version.zip](#), where [version](#) indicates the Connector/NET version.

To install Connector/NET:

1. Double click on the MSI installer file extracted from the Zip you downloaded. Click NEXT to start the installation.

2. You must choose the type of installation that you want to perform.

For most situations, the Typical installation will be suitable. Click the TYPICAL button and proceed to Step 5. A Complete installation installs all the available files. To conduct a Complete installation, click the COMPLETE button and proceed to step 5. If you want to customize your installation, including choosing the components to install and some installation options, click the CUSTOM button and proceed to Step 3.

The Connector/NET installer will register the connector within the Global Assembly Cache (GAC) - this will make the Connector/NET component available to all applications, not just those where you explicitly reference the Connector/NET component. The installer will also create the necessary links in the Start menu to the documentation and release notes.

3. If you have chosen a custom installation, you can select the individual components that you want to install, including the core interface component, supporting documentation (a CHM file) samples and examples and the source code. Select the items, and their installation level, and then click NEXT to continue the installation.

Note

For Connector/NET 1.0.8 or lower and Connector 5.0.4 and lower the installer will attempt to install binaries for both 1.x and 2.x of the .NET Framework. If you only have one version of the framework installed, the connector installation may fail. If this happens, you can choose the framework version to be installed through the custom installation step.

4. You will be given a final opportunity to confirm the installation. Click INSTALL to copy and install the files onto your machine.

5. Once the installation has been completed, click FINISH to exit the installer.

Unless you choose otherwise, Connector/NET is installed in `C:\Program Files\MySQL\MySQL Connector Net X.X.X`, where `X.X.X` is replaced with the version of Connector/NET you are installing. New installations do not overwrite existing versions of Connector/NET.

Depending on your installation type, the installed components will include some or all of the following components:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `docs` - contains a CHM of the Connector/NET documentation.
- `samples` - sample code and applications that use the Connector/NET component.
- `src` - the source code for the Connector/NET component.

You may also use the `/quiet` or `/q` command line option with the `msiexec` tool to install the Connector/NET package automatically (using the default options) with no notification to the user. Using this option you cannot select options and no prompts, messages or dialog boxes will be displayed.

```
C:\> msiexec /package conector-net.msi /quiet
```

To provide a progress bar to the user during automatic installation, but still without presenting the user with a dialog box of the ability

to select options, use the `/passive` option.

26.2.2.1.2. Installing Connector/NET using the Zip package

If you are having problems running the installer, you can download a .zip file without an installer as an alternative. That file is called `mysql-connector-net-version-noinstall.zip`. Once downloaded, you can extract the files to a location of your choice.

The .zip file contains the following directories:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `doc` - contains a CHM of the Connector/NET documentation.
- `Samples` - sample code and applications that use the Connector/NET component.
- `mysqlclient` - the source code for the Connector/NET component.
- `testsuite` - the test suite used to verify the operation of the Connector/NET component.

26.2.2.2. Installing Connector/NET on Unix with Mono

There is no installer available for installing the Connector/NET component on your Unix installation. However, the installation is very simple. Before installing, please ensure that you have a working Mono project installation.

Note that you should only install the Connector/NET component on Unix environments where you want to connect to a MySQL server through the Mono project. If you are deploying or developing on a different environment such as Java or Perl then you should use a more appropriate connectivity component. See [Chapter 26, Connectors](#), or [Chapter 25, APIs and Libraries](#), for more information.

To install Connector/NET on Unix/Mono:

1. Download the `mysql-connector-net-version-noinstall.zip` and extract the contents.
2. Copy the `MySQL.Data.dll` file to your Mono project installation folder.
3. You must register the Connector/NET component in the Global Assembly Cache using the `gacutil` command:

```
shell> gacutil /i MySQL.Data.dll
```

Once installed, applications that are compiled with the Connector/NET component need no further changes. However, you must ensure that when you compile your applications you include the Connector/NET component using the `-r:MySQLData.dll` command line option.

26.2.2.3. Installing Connector/NET using the Source

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get Connector/NET up and running on your system, you should use a standard release distribution.

To be able to access the Connector/NET source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/NET sources, change to the directory where you want the copy of the Connector/NET tree to be stored, then use the following command:

```
shell> svn co  
http://svn.mysql.com/svnpublic/connector-net
```

A Visual Studio project is included in the source which you can use to build Connector/NET.

26.2.3. Connector/NET Examples and Usage Guide

Connector/NET comprises several classes that are used to connect to the database, execute queries and statements, and manage query results.

The following are the major classes of Connector/NET:

- **MySqlCommand**: Represents an SQL statement to execute against a MySQL database.
- **MySqlCommandBuilder**: Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated MySQL database.
- **MySqlConnection**: Represents an open connection to a MySQL Server database.
- **MySqlDataAdapter**: Represents a set of data commands and a database connection that are used to fill a dataset and update a MySQL database.
- **MySqlDataReader**: Provides a means of reading a forward-only stream of rows from a MySQL database.
- **MySqlException**: The exception that is thrown when MySQL returns an error.
- **MySqlHelper**: Helper class that makes it easier to work with the provider.
- **MySqlTransaction**: Represents an SQL transaction to be made in a MySQL database.

This section contains basic information and examples for each of the above classes. For a more detailed reference guide please see [Section 26.2.4, “Connector/NET Reference”](#).

26.2.3.1. Using MySqlCommand

Represents a SQL statement to execute against a MySQL database. This class cannot be inherited.

MySqlCommand features the following methods for executing commands at a MySQL database:

Item	Description
ExecuteReader	Executes commands that return rows.
ExecuteNonQuery	Executes commands such as SQL INSERT, DELETE, and UPDATE statements.
ExecuteScalar	Retrieves a single value (for example, an aggregate value) from a database.

You can reset the **CommandText** property and reuse the **MySqlCommand** object. However, you must close the **MySqlDataReader** before you can execute a new or previous command.

If a **MySqlException** is generated by the method executing a **MySqlCommand**, the **MySqlConnection** remains open. It is the responsibility of the programmer to close the connection.

Note

Prior versions of the provider used the '@' symbol to mark parameters in SQL. This is incompatible with MySQL user variables, so the provider now uses the '?' symbol to locate parameters in SQL. To support older code, you can set 'old syntax=yes' on your connection string. If you do this, please be aware that an exception will not be thrown if you fail to define a parameter that you intended to use in your SQL.

Examples

The following example creates a **MySqlCommand** and a **MySqlConnection**. The **MySqlConnection** is opened and set as the **Connection** for the **MySqlCommand**. The example then calls **ExecuteNonQuery**, and closes the connection. To accomplish this, the

`ExecuteNonQuery` is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    " If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
    Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
    Dim myCommand As New MySqlCommand(myInsertQuery)
    myCommand.Connection = myConnection
    myConnection.Open()
    myCommand.ExecuteNonQuery()
    myCommand.Connection.Close()
End Sub
```

C# example:

```
public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}
```

26.2.3.1.1. Class MySqlCommand Constructor Form 1

Overload methods for MySqlCommand

Initializes a new instance of the MySqlCommand class.

Examples

The following example creates a MySqlCommand and sets some of its properties.

Note

This example shows how to use one of the overloaded versions of the `MySqlCommand` constructor. For other examples that might be available, see the individual overload topics.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myConnection As New MySqlConnection _
        ("Persist Security Info=False;database=test;server=myServer")
    myConnection.Open()
    Dim myTrans As MySqlTransaction = myConnection.BeginTransaction()
    Dim mySelectQuery As String = "SELECT * FROM MyTable"
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection, myTrans)
    myCommand.CommandTimeout = 20
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlConnection myConnection = new MySqlConnection("Persist Security Info=False;
        database=test;server=myServer");
    myConnection.Open();
    MySqlTransaction myTrans = myConnection.BeginTransaction();
    string mySelectQuery = "SELECT * FROM myTable";
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand.CommandTimeout = 20;
}
```

C++ example:

```
public:
void CreateMySQLCommand()
{
    MySqlConnection* myConnection = new MySqlConnection(S"Persist Security Info=False;
        database=test;server=myServer");
    myConnection->Open();
    MySqlTransaction* myTrans = myConnection->BeginTransaction();
    String* mySelectQuery = S"SELECT * FROM myTable";
    MySqlCommand* myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand->CommandTimeout = 20;
};
```

Initializes a new instance of the `MySQLCommand` class.

The base constructor initializes all fields to their default values. The following table shows initial property values for an instance of `MySQLCommand`.

Properties	Initial Value
CommandText	empty string ("")
CommandTimeout	0
CommandType	<code>CommandType.Text</code>
Connection	Null

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a `MySQLCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandType = CommandType.Text;
}
```

26.2.3.1.2. Class `MySQLCommand` Constructor Form 2

Initializes a new instance of the `MySQLCommand` class with the text of the query.

Parameters: The text of the query.

When an instance of `MySQLCommand` is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	<code>cmdText</code>
CommandTimeout	0
CommandType	<code>CommandType.Text</code>
Connection	Null

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()  
    Dim sql as String = "SELECT * FROM mytable"  
    Dim myCommand As New MySQLCommand(sql)  
    myCommand.CommandType = CommandType.Text  
End Sub
```

C# example:

```
public void CreateMySQLCommand()  
{  
    string sql = "SELECT * FROM mytable";  
    MySqlCommand myCommand = new MySqlCommand(sql);  
    myCommand.CommandType = CommandType.Text;  
}
```

26.2.3.1.3. Class MySqlCommand Constructor Form 3

Initializes a new instance of the [MySQLCommand](#) class with the text of the query and a [MySQLConnection](#).

Parameters: The text of the query.

Parameters: A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	0
CommandType	CommandType.Text
Connection	connection

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()  
    Dim conn as new MySQLConnection("server=myServer")  
    Dim sql as String = "SELECT * FROM mytable"  
    Dim myCommand As New MySqlCommand(sql, conn)  
    myCommand.CommandType = CommandType.Text  
End Sub
```

C# example:

```
public void CreateMySQLCommand()  
{  
    MySqlConnection conn = new MySqlConnection("server=myserver")  
    string sql = "SELECT * FROM mytable";  
    MySqlCommand myCommand = new MySqlCommand(sql, conn);  
    myCommand.CommandType = CommandType.Text;  
}
```

26.2.3.1.4. Class MySqlCommand Constructor Form 4

Initializes a new instance of the [MySQLCommand](#) class with the text of the query, a [MySQLConnection](#), and the [MySQLTransaction](#).

Parameters: The text of the query.

Parameters: A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

Parameters: The [MySQLTransaction](#) in which the [MySQLCommand](#) executes.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	0
CommandType	CommandType.Text
Connection	connection

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim conn as new MySqlConnection("server=myServer")
    conn.Open();
    Dim txn as MySQLTransaction = conn.BeginTransaction()
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySQLCommand(sql, conn, txn)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlConnection conn = new MySqlConnection("server=myserver")
    conn.Open();
    MySQLTransaction txn = conn.BeginTransaction();
    string sql = "SELECT * FROM mytable";
    MySQLCommand myCommand = new MySQLCommand(sql, conn, txn);
    myCommand.CommandType = CommandType.Text;
}
```

26.2.3.1.5. ExecuteNonQuery

Executes a SQL statement against the connection and returns the number of rows affected.

Returns: Number of rows affected

You can use [ExecuteNonQuery](#) to perform any type of database operation, however any resultsets returned will not be available. Any output parameters used in calling a stored procedure will be populated with data and can be retrieved after execution is complete. For UPDATE, INSERT, and DELETE statements, the return value is the number of rows affected by the command. For all other types of statements, the return value is -1.

Examples

The following example creates a [MySQLCommand](#) and then executes it using [ExecuteNonQuery](#). The example is passed a string that is a SQL statement (such as UPDATE, INSERT, or DELETE) and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySQLCommand(myExecuteQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySQLCommand(myExecuteQuery, myConnection)
    myCommand.Connection.Open()
```

```

myCommand.ExecuteNonQuery()
myConnection.Close()
End Sub

```

C# example:

```

public void CreateMySQLCommand(string myExecuteQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(myExecuteQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteNonQuery();
    myConnection.Close();
}

```

26.2.3.1.6. ExecuteReader1

Sends the [CommandText](#) to the [MySQLConnection](#)Connection, and builds a [MySQLDataReader](#) using one of the [CommandBehavior](#) values.

Parameters: One of the [CommandBehavior](#) values.

When the [CommandType](#) property is set to [StoredProcedure](#), the [CommandText](#) property should be set to the name of the stored procedure. The command executes this stored procedure when you call [ExecuteReader](#).

The [MySQLDataReader](#) supports a special mode that enables large binary values to be read efficiently. For more information, see the [SequentialAccess](#) setting for [CommandBehavior](#).

While the [MySQLDataReader](#) is in use, the associated [MySQLConnection](#) is busy serving the [MySQLDataReader](#). While in this state, no other operations can be performed on the [MySQLConnection](#) other than closing it. This is the case until the [MySQLDataReader.Close](#) method of the [MySQLDataReader](#) is called. If the [MySQLDataReader](#) is created with [CommandBehavior](#) set to [CloseConnection](#), closing the [MySQLDataReader](#) closes the connection automatically.

Note

When calling [ExecuteReader](#) with the [SingleRow](#) behavior, you should be aware that using a [limit](#) clause in your SQL will cause all rows (up to the limit given) to be retrieved by the client. The [MySQLDataReader.Read](#) method will still return false after the first row but pulling all rows of data into the client will have a performance impact. If the [limit](#) clause is not necessary, it should be avoided.

Returns: A [MySQLDataReader](#) object.

26.2.3.1.7. Using ExecuteReader

Sends the [CommandText](#) to the [MySQLConnection](#)Connection and builds a [MySQLDataReader](#).

Returns: A [MySQLDataReader](#) object.

When the [CommandType](#) property is set to [StoredProcedure](#), the [CommandText](#) property should be set to the name of the stored procedure. The command executes this stored procedure when you call [ExecuteReader](#).

While the [MySQLDataReader](#) is in use, the associated [MySQLConnection](#) is busy serving the [MySQLDataReader](#). While in this state, no other operations can be performed on the [MySQLConnection](#) other than closing it. This is the case until the [MySQLDataReader.Close](#) method of the [MySQLDataReader](#) is called.

Examples

The following example creates a [MySQLCommand](#), then executes it by passing a string that is a SQL [SELECT](#) statement, and a string to use to connect to the data source.

Visual Basic example:

```

Public Sub CreateMySQLDataReader(mySelectQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySQLDataReader
    myReader = myCommand.ExecuteReader()
    Try

```

```
While myReader.Read()  
    Console.WriteLine(myReader.GetString(0))  
End While  
Finally  
    myReader.Close  
    myConnection.Close  
End Try  
End Sub
```

C# example:

```
public void CreateMySqlDataReader(string mySelectQuery, MySqlConnection myConnection)  
{  
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);  
    myConnection.Open();  
    MySqlDataReader myReader;  
    myReader = myCommand.ExecuteReader();  
    try  
    {  
        while(myReader.Read())  
        {  
            Console.WriteLine(myReader.GetString(0));  
        }  
    }  
    finally  
    {  
        myReader.Close();  
        myConnection.Close();  
    }  
}
```

26.2.3.1.8. Using **Prepare**

Creates a prepared version of the command on an instance of MySQL Server.

Prepared statements are only supported on MySQL version 4.1 and higher. Calling prepare while connected to earlier versions of MySQL will succeed but will execute the statement in the same way as unprepared.

Examples

The following example demonstrates the use of the **Prepare** method.

Visual Basic example:

```
public sub PrepareExample()  
    Dim cmd as New MySqlCommand("INSERT INTO mytable VALUES (?val)", myConnection)  
    cmd.Parameters.Add( "?val", 10 )  
    cmd.Prepare()  
    cmd.ExecuteNonQuery()  
  
    cmd.Parameters(0).Value = 20  
    cmd.ExecuteNonQuery()  
end sub
```

C# example:

```
private void PrepareExample()  
{  
    MySqlCommand cmd = new MySqlCommand("INSERT INTO mytable VALUES (?val)", myConnection);  
    cmd.Parameters.Add( "?val", 10 );  
    cmd.Prepare();  
    cmd.ExecuteNonQuery();  
  
    cmd.Parameters[0].Value = 20;  
    cmd.ExecuteNonQuery();  
}
```

26.2.3.1.9. ExecuteScalar

Executes the query, and returns the first column of the first row in the result set returned by the query. Extra columns or rows are ignored.

Returns: The first column of the first row in the result set, or a null reference if the result set is empty

Use the [ExecuteScalar](#) method to retrieve a single value (for example, an aggregate value) from a database. This requires less code than using the [ExecuteReader](#) method, and then performing the operations necessary to generate the single value using the data returned by a [MySqlDataReader](#).

A typical [ExecuteScalar](#) query can be formatted as in the following C# example:

C# example:

```
cmd.CommandText = "select count(*) from region";
Int32 count = (int32) cmd.ExecuteScalar();
```

Examples

The following example creates a [MySqlCommand](#) and then executes it using [ExecuteScalar](#). The example is passed a string that is a SQL statement that returns an aggregate result, and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySqlCommand(myScalarQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(myScalarQuery, myConnection)
    myCommand.Connection.Open()
    myCommand.ExecuteScalar()
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySqlCommand(string myScalarQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(myScalarQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteScalar();
    myConnection.Close();
}
```

C++ example:

```
public:
    void CreateMySqlCommand(String* myScalarQuery, MySqlConnection* myConnection)
    {
        MySqlCommand* myCommand = new MySqlCommand(myScalarQuery, myConnection);
        myCommand->Connection->Open();
        myCommand->ExecuteScalar();
        myConnection->Close();
    }
```

26.2.3.1.10. CommandText

Gets or sets the SQL statement to execute at the data source.

Value: The SQL statement or stored procedure to execute. The default is an empty string.

When the [CommandType](#) property is set to [StoredProcedure](#), the [CommandText](#) property should be set to the name of the stored procedure. The user may be required to use escape character syntax if the stored procedure name contains any special characters. The command executes this stored procedure when you call one of the Execute methods.

Examples

The following example creates a [MySqlCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandText = "SELECT * FROM Mytable ORDER BY id"
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandText = "SELECT * FROM mytable ORDER BY id";
    myCommand.CommandType = CommandType.Text;
}
```

26.2.3.1.11. CommandTimeout

Gets or sets the wait time before terminating the attempt to execute a command and generating an error.

Value: The time (in seconds) to wait for the command to execute. The default is 0 seconds.

MySQL currently does not support any method of canceling a pending or executing operation. All commands issued against a MySQL server will execute until completion or until an exception occurs.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about `CommandTimeout` in the Knowledge Base article, [Why CommandTimeout is not Supported](https://www.mysql.com/products/enterprise/advisors.html). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <https://www.mysql.com/products/enterprise/advisors.html>.

26.2.3.1.12. CommandType

Gets or sets a value indicating how the `CommandText` property is to be interpreted.

Value: One of the `System.Data.CommandType` values. The default is `Text`.

When you set the `CommandType` property to `StoredProcedure`, you should set the `CommandText` property to the name of the stored procedure. The command executes this stored procedure when you call one of the `Execute` methods.

Examples

The following example creates a `MySqlCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandType = CommandType.Text;
}
```

26.2.3.1.13. Connection

Gets or sets the `MySqlConnection` used by this instance of the `MySqlCommand`.

Value: The connection to a data source. The default value is a null reference (`Nothing` in Visual Basic).

If you set `Connection` while a transaction is in progress and the `Transaction` property is not null, an `InvalidOperationException` is generated. If the `Transaction` property is not null and the transaction has already been committed or rolled back, `Transaction` is set to null.

Examples

The following example creates a `MySqlCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim mySelectQuery As String = "SELECT * FROM mytable ORDER BY id"
```

```

Dim myConnectionString As String = "Persist Security Info=False;database=test;server=myServer"
Dim myCommand As New MySqlCommand(mySelectQuery)
myCommand.Connection = New MySqlConnection(myConnectionString)
myCommand.CommandType = CommandType.Text
End Sub

```

C# example:

```

public void CreateMySqlCommand()
{
    string mySelectQuery = "SELECT * FROM mytable ORDER BY id";
    string myConnectionString = "Persist Security Info=False;database=test;server=myServer";
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery);
    myCommand.Connection = new MySqlConnection(myConnectionString);
    myCommand.CommandType = CommandType.Text;
}

```

26.2.3.1.14. IsPrepared

Returns true if the statement is prepared.

26.2.3.1.15. Parameters

Get the [MySqlParameterCollection](#)

Value: The parameters of the SQL statement or stored procedure. The default is an empty collection.

Connector/Net does not support unnamed parameters. Every parameter added to the collection must have an associated name.

Examples

The following example creates a [MySqlCommand](#) and displays its parameters. To accomplish this, the method is passed a [MySqlConnection](#), a query string that is a SQL [SELECT](#) statement, and an array of [MySqlParameter](#) objects.

Visual Basic example:

```

Public Sub CreateMySqlCommand(myConnection As MySqlConnection, _
mySelectQuery As String, myParamArray() As SqlParameter)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=?age"
    myCommand.UpdatedRowSource = UpdateRowSource.Both
    myCommand.Parameters.Add(myParamArray)
    Dim j As Integer
    For j = 0 To myCommand.Parameters.Count - 1
        myCommand.Parameters.Add(myParamArray(j))
    Next j
    Dim myMessage As String = ""
    Dim i As Integer
    For i = 0 To myCommand.Parameters.Count - 1
        myMessage += myCommand.Parameters(i).ToString() & ControlChars.Cr
    Next i
    Console.WriteLine(myMessage)
End Sub

```

C# example:

```

public void CreateMySqlCommand(MySqlConnection myConnection, string mySelectQuery,
    SqlParameter[] myParamArray)
{
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=?age";
    myCommand.Parameters.Add(myParamArray);
    for (int j=0; j<myParamArray.Length; j++)
    {
        myCommand.Parameters.Add(myParamArray[j]) ;
    }
    string myMessage = "";
    for (int i = 0; i < myCommand.Parameters.Count; i++)
    {
        myMessage += myCommand.Parameters[i].ToString() + "\n";
    }
    MessageBox.Show(myMessage);
}

```

26.2.3.1.16. Transaction

Gets or sets the `MySqlCommandTransaction` within which the `MySqlCommand` executes.

Value: The `MySqlCommandTransaction`. The default value is a null reference (`Nothing` in Visual Basic).

You cannot set the `Transaction` property if it is already set to a specific value, and the command is in the process of executing. If you set the transaction property to a `MySqlCommandTransaction` object that is not connected to the same `MySqlConnection` as the `MySqlCommand` object, an exception will be thrown the next time you attempt to execute a statement.

26.2.3.1.17. UpdatedRowSource

Gets or sets how command results are applied to the `DataRow` when used by the `System.Data.Common.DbDataAdapter.Update` method of the `System.Data.Common.DbDataAdapter`.

Value: One of the `UpdateRowSource` values.

The default `System.Data.UpdateRowSource` value is `Both` unless the command is automatically generated (as in the case of the `MySqlCommandBuilder`), in which case the default is `None`.

26.2.3.2. Using MySqlCommandBuilder

Automatically generates single-table commands used to reconcile changes made to a `DataSet` with the associated MySQL database. This class cannot be inherited.

The `MySqlDataAdapter` does not automatically generate the SQL statements required to reconcile changes made to a `System.Data.DataSet` with the associated instance of MySQL. However, you can create a `MySqlCommandBuilder` object to automatically generate SQL statements for single-table updates if you set the `MySqlDataAdapter.SelectCommand` property of the `MySqlDataAdapter`. Then, any additional SQL statements that you do not set are generated by the `MySqlCommandBuilder`.

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.OnRowUpdating` events whenever you set the `DataAdapter` property. You can only associate one `MySqlDataAdapter` or `MySqlCommandBuilder` object with each other at one time.

To generate INSERT, UPDATE, or DELETE statements, the `MySqlCommandBuilder` uses the `SelectCommand` property to retrieve a required set of metadata automatically. If you change the `SelectCommand` after the metadata has been retrieved (for example, after the first update), you should call the `RefreshSchema` method to update the metadata.

The `SelectCommand` must also return at least one primary key or unique column. If none are present, an `InvalidOperationException` exception is generated, and the commands are not generated.

When using `MySqlCommandBuilder` and `INSERT` you should set the `ReturnGeneratedIdentifiers` property to `true` to ensure that `AUTO_INCREMENT` fields in MySQL tables return the automatically generated value.

The `MySqlCommandBuilder` also uses the `MySqlCommand.Connection`, `MySqlCommand.CommandTimeout`, and `MySqlCommand.Transaction` properties referenced by the `SelectCommand`. The user should call `RefreshSchema` if any of these properties are modified, or if the `SelectCommand` itself is replaced. Otherwise the `MySqlDataAdapter.InsertCommand`, `MySqlDataAdapter.UpdateCommand`, and `MySqlDataAdapter.DeleteCommand` properties retain their previous values.

If you call `Dispose`, the `MySqlCommandBuilder` is disassociated from the `MySqlDataAdapter`, and the generated commands are no longer used.

Note

Caution must be used when using `MySqlCommandBuilder` on MySQL 4.0 systems. With MySQL 4.0, database/schema information is not provided to the connector for a query. This means that a query that pulls columns from two identically named tables in two or more different databases will not cause an exception to be thrown but will not work correctly. Even more dangerous is the situation where your select statement references database X but is executed in database Y and both databases have tables with similar layouts. This situation can cause unwanted changes or deletes. This note does not apply to MySQL versions 4.1 and later.

Examples

The following example uses the [MySqlCommand](#) , along [MySqlDataAdapter](#) and [MySqlConnection](#) , to select rows from a data source. The example is passed an initialized [System.Data.DataSet](#) , a connection string, a query string that is a SQL [SELECT](#) statement, and a string that is the name of the database table. The example then creates a [MySqlCommandBuilder](#) .

Visual Basic example:

```
Public Shared Function SelectRows(myConnection As String, mySelectQuery As String, myTableName As String) As DataSet
    Dim myConn As New MySqlConnection(myConnection)
    Dim myDataAdapter As New MySqlDataAdapter()
    myDataAdapter.SelectCommand = New MySqlCommand(mySelectQuery, myConn)
    Dim cb As SqlCommandBuilder = New MySqlCommandBuilder(myDataAdapter)
    myConn.Open()
    Dim ds As DataSet = New DataSet
    myDataAdapter.Fill(ds, myTableName)
    ' Code to modify data in DataSet here
    ' Without the MySqlCommandBuilder this line would fail.
    myDataAdapter.Update(ds, myTableName)
    myConn.Close()
End Function 'SelectRows
```

C# example:

```
public static DataSet SelectRows(string myConnection, string mySelectQuery, string myTableName)
{
    MySqlConnection myConn = new MySqlConnection(myConnection);
    MySqlDataAdapter myDataAdapter = new MySqlDataAdapter();
    myDataAdapter.SelectCommand = new MySqlCommand(mySelectQuery, myConn);
    MySqlCommandBuilder cb = new MySqlCommandBuilder(myDataAdapter);
    myConn.Open();
    DataSet ds = new DataSet();
    myDataAdapter.Fill(ds, myTableName);
    //code to modify data in DataSet here
    //Without the MySqlCommandBuilder this line would fail
    myDataAdapter.Update(ds, myTableName);
    myConn.Close();
    return ds;
}
```

26.2.3.2.1. Class MySqlCommandBuilder Constructor

Initializes a new instance of the [MySqlCommandBuilder](#) class.

26.2.3.2.2. Class MySqlCommandBuilder Constructor Form 1

Initializes a new instance of the [MySqlCommandBuilder](#) class and sets the last one wins property.

Parameters: False to generate change protection code. True otherwise.

The [lastOneWins](#) parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If [lastOneWins](#) is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded environments. Setting [lastOneWins](#) to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

26.2.3.2.3. Class MySqlCommandBuilder Constructor Form 2

Initializes a new instance of the [MySqlCommandBuilder](#) class with the associated [MySqlDataAdapter](#) object.

Parameters: The [MySqlDataAdapter](#) to use.

The [MySqlCommandBuilder](#) registers itself as a listener for [MySqlDataAdapter.RowUpdating](#) events that are generated by the [MySqlDataAdapter](#) specified in this property.

When you create a new instance [MySqlCommandBuilder](#) , any existing [MySqlCommandBuilder](#) associated with this [MySqlDataAdapter](#) is released.

26.2.3.2.4. Class MySqlCommandBuilder Constructor Form 3

Initializes a new instance of the [MySqlCommandBuilder](#) class with the associated [MySqlDataAdapter](#) object.

Parameters: The [MySqlDataAdapter](#) to use.

Parameters: False to generate change protection code. True otherwise.

The `MySQLCommandBuilder` registers itself as a listener for `MySQLDataAdapter.RowUpdating` events that are generated by the `MySQLDataAdapter` specified in this property.

When you create a new instance `MySQLCommandBuilder`, any existing `MySQLCommandBuilder` associated with this `MySQLDataAdapter` is released.

The `lastOneWins` parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If `lastOneWins` is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded environments. Setting `lastOneWins` to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

26.2.3.2.5. DataAdapter

Gets or sets a `MySQLDataAdapter` object for which SQL statements are automatically generated.

Value: A `MySQLDataAdapter` object.

The `MySQLCommandBuilder` registers itself as a listener for `MySQLDataAdapter.RowUpdating` events that are generated by the `MySQLDataAdapter` specified in this property.

When you create a new instance `MySQLCommandBuilder`, any existing `MySQLCommandBuilder` associated with this `MySQLDataAdapter` is released.

26.2.3.2.6. QuotePrefix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

Value: The beginning character or characters to use. The default value is `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySQLCommandBuilder` to build SQL commands that handle this situation.

26.2.3.2.7. QuoteSuffix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

Value: The beginning character or characters to use. The default value is `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySQLCommandBuilder` to build SQL commands that handle this situation.

26.2.3.2.8. DeriveParameters

26.2.3.2.9. GetDeleteCommand

Gets the automatically generated `MySQLCommand` object required to perform deletions on the database.

Returns: The `MySQLCommand` object generated to handle delete operations.

An application can use the `GetDeleteCommand` method for informational or troubleshooting purposes because it returns the `MySQLCommand` object to be executed.

You can also use `GetDeleteCommand` as the basis of a modified command. For example, you might call `GetDeleteCommand` and modify the `MySQLCommand.CommandTimeout` value, and then explicitly set that on the `MySQLDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetDeleteCommand` will be still be using information from the previous statement, which might not be correct.

The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetDeleteCommand`.

26.2.3.2.10. GetInsertCommand

Gets the automatically generated `MySqlCommand` object required to perform insertions on the database.

Returns: The `MySqlCommand` object generated to handle insert operations.

An application can use the `GetInsertCommand` method for informational or troubleshooting purposes because it returns the `MySqlCommand` object to be executed.

You can also use the `GetInsertCommand` as the basis of a modified command. For example, you might call `GetInsertCommand` and modify the `MySqlCommand.CommandTimeout` value, and then explicitly set that on the `MySqlDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetInsertCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetInsertCommand`.

26.2.3.2.11. GetUpdateCommand

Gets the automatically generated `MySqlCommand` object required to perform updates on the database.

Returns: The `MySqlCommand` object generated to handle update operations.

An application can use the `GetUpdateCommand` method for informational or troubleshooting purposes because it returns the `MySqlCommand` object to be executed.

You can also use `GetUpdateCommand` as the basis of a modified command. For example, you might call `GetUpdateCommand` and modify the `MySqlCommand.CommandTimeout` value, and then explicitly set that on the `MySqlDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetUpdateCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetUpdateCommand`.

26.2.3.2.12. RefreshSchema

Refreshes the database schema information used to generate INSERT, UPDATE, or DELETE statements.

An application should call `RefreshSchema` whenever the `SELECT` statement associated with the `MySqlCommandBuilder` changes.

An application should call `RefreshSchema` whenever the `MySqlDataAdapter.SelectCommand` value of the `MySqlDataAdapter` changes.

MySQL Enterprise

MySQL Enterprise subscribers will find more information on this topic in the Knowledge Base article, [Understanding MySqlCommandBuilder and the LastOneWins Setting](http://www.mysql.com/products/enterprise/advisors.html). For information about subscribing to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

26.2.3.3. Using MySqlConnection

Represents an open connection to a MySQL Server database. This class cannot be inherited.

A `MySqlConnection` object represents a session to a MySQL Server data source. When you create an instance of `MySqlConnection`, all properties are set to their initial values. For a list of these values, see the `MySqlConnection` constructor.

If the `MySqlConnection` goes out of scope, it is not closed. Therefore, you must explicitly close the connection by calling `MySqlConnection.Close` or `MySqlConnection.Dispose`.

Examples

The following example creates a `MySqlCommand` and a `MySqlConnection`. The `MySqlConnection` is opened and set as the `MySqlCommand.Connection` for the `MySqlCommand`. The example then calls `MySqlCommand.ExecuteNonQuery`, and

closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    ' If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
    Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
    Dim myCommand As New MySqlCommand(myInsertQuery)
    myCommand.Connection = myConnection
    myConnection.Open()
    myCommand.ExecuteNonQuery()
    myCommand.Connection.Close()
End Sub
```

C# example:

```
public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}
```

26.2.3.3.1. Class MySqlConnection Constructor (Default)

Initializes a new instance of the `MySqlConnection` class.

When a new instance of `MySqlConnection` is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the `ConnectionString` property.

Properties	Initial Value
<code>ConnectionString</code>	empty string ("")
<code>ConnectionTimeout</code>	15
<code>Database</code>	empty string ("")
<code>DataSource</code>	empty string ("")
<code>ServerVersion</code>	empty string ("")

You can change the value for these properties only by using the `ConnectionString` property.

Examples

Overload methods for MySqlConnection

Initializes a new instance of the `MySqlConnection` class.

26.2.3.3.2. Class MySqlConnection Constructor Form 1

Initializes a new instance of the `MySqlConnection` class when given a string containing the connection string.

When a new instance of `MySqlConnection` is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the `ConnectionString` property.

Properties	Initial Value

ConnectionString	empty string ("")
ConnectionTimeout	15
Database	empty string ("")
DataSource	empty string ("")
ServerVersion	empty string ("")

You can change the value for these properties only by using the [ConnectionString](#) property.

Examples

Parameters: The connection properties used to open the MySQL database.

26.2.3.3.3. Open

Opens a database connection with the property settings specified by the [ConnectionString](#).

Exception: Cannot open a connection without specifying a data source or server.

Exception: A connection-level error occurred while opening the connection.

The [MySQLConnection](#) draws an open connection from the connection pool if one is available. Otherwise, it establishes a new connection to an instance of MySQL.

Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

26.2.3.3.4. Database

Gets the name of the current database or the database to be used after a connection is opened.

Returns: The name of the current database or the name of the database to be used after a connection is opened. The default value is an empty string.

The [Database](#) property does not update dynamically. If you change the current database using a SQL statement, then this property may reflect the wrong value. If you change the current database using the [ChangeDatabase](#) method, this property is updated to reflect the new database.

Examples

The following example creates a [MySQLConnection](#) and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()  
    Dim myConnString As String = _  
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"  
    Dim myConnection As New MySqlConnection( myConnString )  
    myConnection.Open()  
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _  
        + ControlChars.NewLine + "Database: " + myConnection.Database )  
    myConnection.ChangeDatabase( "test2" )  
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _  
        + ControlChars.NewLine + "Database: " + myConnection.Database )  
    myConnection.Close()  
End Sub
```

C# example:

```
public void CreateMySQLConnection()  
{  
    string myConnString =  
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";  
    MySqlConnection myConnection = new MySqlConnection( myConnString );  
    myConnection.Open();  
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion  
        + "\nDatabase: " + myConnection.Database );  
    myConnection.ChangeDatabase( "test2" );  
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion  
        + "\nDatabase: " + myConnection.Database );  
    myConnection.Close();  
}
```

26.2.3.3.5. State

Gets the current state of the connection.

Returns: A bitwise combination of the [System.Data.ConnectionState](#) values. The default is [Closed](#).

The allowed state changes are:

- From [Closed](#) to [Open](#), using the [Open](#) method of the connection object.
- From [Open](#) to [Closed](#), using either the [Close](#) method or the [Dispose](#) method of the connection object.

Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)  
    Dim myConnection As New MySqlConnection(myConnString)  
    myConnection.Open()  
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _  
        + ControlChars.Cr + "State: " + myConnection.State.ToString())  
    myConnection.Close()  
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)  
{  
    MySqlConnection myConnection = new MySqlConnection(myConnString);  
    myConnection.Open();  
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +  
        "\nState: " + myConnection.State.ToString());  
    myConnection.Close();  
}
```

26.2.3.3.6. ServerVersion

Gets a string containing the version of the MySQL server to which the client is connected.

Returns: The version of the instance of MySQL.

Exception: The connection is closed.

Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

26.2.3.3.7. Close

Closes the connection to the database. This is the preferred method of closing any open connection.

The [Close](#) method rolls back any pending transactions. It then releases the connection to the connection pool, or closes the connection if connection pooling is disabled.

An application can call [Close](#) more than one time. No exception is generated.

Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

26.2.3.3.8. CreateCommand

Creates and returns a [MySQLCommand](#) object associated with the [MySQLConnection](#).

Returns: A [MySQLCommand](#) object.

26.2.3.3.9. BeginTransaction

Begins a database transaction.

Returns: An object representing the new transaction.

Exception: Parallel transactions are not supported.

This command is equivalent to the MySQL BEGIN TRANSACTION command.

You must explicitly commit or roll back the transaction using the [MySQLTransaction.Commit](#) or [MySQLTransaction.Rollback](#) method.

Note

If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [BeginTransaction](#) method, use the overload that takes the [iso](#) parameter.

Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [BeginTransaction](#), a [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " + e.GetType().ToString() + _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySQLTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
```

```

try
{
    myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
    myCommand.ExecuteNonQuery();
    myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
    myCommand.ExecuteNonQuery();
    myTrans.Commit();
    Console.WriteLine("Both records are written to database.");
}
catch(Exception e)
{
    try
    {
        myTrans.Rollback();
    }
    catch (SqlException ex)
    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
    }

    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

26.2.3.3.10. BeginTransaction1

Begins a database transaction with the specified isolation level.

Parameters: The isolation level under which the transaction should run.

Returns: An object representing the new transaction.

Exception: Parallel exceptions are not supported.

This command is equivalent to the MySQL BEGIN TRANSACTION command.

You must explicitly commit or roll back the transaction using the [MySQLTransaction.Commit](#) or [MySQLTransaction.Rollback](#) method.

Note

If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [BeginTransaction](#) method, use the overload that takes the [iso](#) parameter.

Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [BeginTransaction](#), a [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```

Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
    
```

```

        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " + e.GetType().ToString() + _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

C# example:

```

public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (SqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

26.2.3.3.11. ChangeDatabase

Changes the current database for an open MySqlConnection.

Parameters: The name of the database to use.

The value supplied in the [database](#) parameter must be a valid database name. The [database](#) parameter cannot contain a null value, an empty string, or a string with only blank characters.

When you are using connection pooling against MySQL, and you close the connection, it is returned to the connection pool. The next

time the connection is retrieved from the pool, the reset connection request executes before the user performs any operations.

MySQL Enterprise

MySQL Enterprise subscribers will find more information on this subject in the Knowledge Base article, [Understanding and Using Connection Pooling](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. To subscribe see <http://www.mysql.com/products/enterprise/advisors.html>.

Exception: The database name is not valid.

Exception: The connection is not open.

Exception: Cannot change the database.

Examples

The following example creates a `MySqlConnection` and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()
    Dim myConnString As String = _
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"
    Dim myConnection As New MySqlConnection( myConnString )
    myConnection.Open()
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.ChangeDatabase( "test2" )
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection()
{
    string myConnString =
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";
    MySqlConnection myConnection = new MySqlConnection( myConnString );
    myConnection.Open();
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.ChangeDatabase( "test2" );
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.Close();
}
```

26.2.3.3.12. StateChange

Occurs when the state of the connection changes.

The `StateChange` event fires whenever the `State` changes from closed to opened, or from opened to closed. `StateChange` fires immediately after the `MySqlConnection` transitions.

If an event handler throws an exception from within the `StateChange` event, the exception propagates to the caller of the `Open` or `Close` method.

The `StateChange` event is not raised unless you explicitly call `Close` or `Dispose`.

The event handler receives an argument of type `System.Data.StateChangeEventArgs` containing data related to this event. The following `StateChangeEventArgs` properties provide information specific to this event.

Property	Description
<code>System.Data.StateChangeEventArgs.CurrentState</code>	Gets the new state of the connection. The connection object will be in the new state already when the event is fired.
<code>System-</code>	Gets the original state of the connection.

<code>tem.Data.StateChangeEventArgs.OriginalState</code>	

26.2.3.3.13. InfoMessage

Occurs when MySQL returns warnings as a result of executing a command or query.

26.2.3.3.14. ConnectionTimeout

Gets the time to wait while trying to establish a connection before terminating the attempt and generating an error.

Exception: The value set is less than 0.

A value of 0 indicates no limit, and should be avoided in a `MySqlConnection.ConnectionString` because an attempt to connect will wait indefinitely.

Examples

The following example creates a `MySqlConnection` and sets some of its properties in the connection string.

Visual Basic example:

```
Public Sub CreateSqlConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;Password=pass;database=test1;server=localhost"
    myConnection.Open()
End Sub
```

C# example:

```
public void CreateSqlConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;»
        Password=pass;database=test1;server=localhost;Connect Timeout=30";
    myConnection.Open();
}
```

26.2.3.3.15. ConnectionString

Gets or sets the string used to connect to a MySQL Server database.

The `ConnectionString` returned may not be exactly like what was originally set but will be identical in terms of keyword/value pairs. Security information will not be included unless the `Persist Security Info` value is set to true.

You can use the `ConnectionString` property to connect to a database. The following example illustrates a typical connection string.

```
"Persist Security Info=False;database=MyDB;»
    server=MySqlServer;user id=myUser;Password=myPass"
```

The `ConnectionString` property can be set only when the connection is closed. Many of the connection string values have corresponding read-only properties. When the connection string is set, all of these properties are updated, except when an error is detected. In this case, none of the properties are updated. `MySqlConnection` properties return only those settings contained in the `ConnectionString`.

To connect to a local machine, specify "localhost" for the server. If you do not specify a server, localhost is assumed.

Resetting the `ConnectionString` on a closed connection resets all connection string values (and related properties) including the password. For example, if you set a connection string that includes "Database= MyDb", and then reset the connection string to "Data Source=myserver;User Id=myUser;Password=myPass", the `MySqlConnection.Database` property is no longer set to MyDb.

The connection string is parsed immediately after being set. If errors in syntax are found when parsing, a runtime exception, such as `ArgumentException`, is generated. Other errors can be found only when an attempt is made to open the connection.

The basic format of a connection string consists of a series of keyword/value pairs separated by semicolons. The equal sign (=) connects

each keyword and its value. Additional notes on setting values for options:

- To include values that contain a semicolon, single-quote character, or double-quote character, the value must be enclosed in double quotes. If the value contains both a semicolon and a double-quote character, the value can be enclosed in single quotes. The single quote is also useful if the value begins with a double-quote character. Conversely, the double quote can be used if the value begins with a single quote. If the value contains both single-quote and double-quote characters, the quote character used to enclose the value must be doubled each time it occurs within the value.
- To include preceding or trailing spaces in the string value, the value must be enclosed in either single quotes or double quotes. Any leading or trailing spaces around integer, Boolean, or enumerated values are ignored, even if enclosed in quotes. However, spaces within a string literal keyword or value are preserved. Using .NET Framework version 1.1, single or double quotes may be used within a connection string without using delimiters (for example, Data Source= my'Server or Data Source= my"Server), unless a quote character is the first or last character in the value.
- To include an equal sign (=) in a keyword or value, it must be preceded by another equal sign. For example, in the hypothetical connection string

```
"key==word=va lue"
```

the keyword is "key=word" and the value is "value".

- If a specific keyword in a keyword= value pair occurs multiple times in a connection string, the last occurrence listed is used in the value set.
- Keywords are not case sensitive.

The following table lists the valid names for keyword values within the [ConnectionString](#).

Name	Default	Description
Connect Timeout , Connection Timeout	15	The length of time (in seconds) to wait for a connection to the server before terminating the attempt and generating an error.
Host , Server , Data Source , Data-Source , Address , Addr , Network Address	localhost	The name or network address of the instance of MySQL to which to connect. Multiple hosts can be specified separated by &. This can be useful where multiple MySQL servers are configured for replication and you are not concerned about the precise server you are connecting to. No attempt is made by the provider to synchronize writes to the database so care should be taken when using this option. In Unix environment with Mono, this can be a fully qualified path to MySQL socket filename. With this configuration, the Unix socket will be used instead of TCP/IP socket. Currently only a single socket name can be given so accessing MySQL in a replicated environment using Unix sockets is not currently supported.
Ignore Prepare	true	When true, instructs the provider to ignore any calls to MySQLCommand.Prepare() . This option is provided to prevent issues with corruption of the statements when use with server side prepared statements. If you want to use server-side prepare statements, set this option to false. This option was added in Connector/NET 5.0.3 and Connector/NET 1.0.9.
Port	3306	The port MySQL is using to listen for connections. Specify -1 for this value to use a named pipe connection (Windows only). This value is ignored if Unix socket is used.
Protocol	socket	Specifies the type of connection to make to the server. Values can be: socket or tcp for a socket connection pipe for a named pipe connection unix for a Unix socket connection memory to use MySQL shared memory
CharSet , Character Set		Specifies the character set that should be used to encode all queries sent to the server. Resultsets are still returned in the character set of the data returned.
Logging	false	When true, various pieces of information is output to any configured TraceListeners .
Allow Batch	true	When true, multiple SQL statements can be sent with one command exe-

		cution. -Note- Starting with MySQL 4.1.1, batch statements should be separated by the server-defined separator character. Commands sent to earlier versions of MySQL should be separated with ';'.
Encrypt	false	For Connector/NET 5.0.3 and later, when true , SSL encryption is used for all data sent between the client and server if the server has a certificate installed. Recognized values are true , false , yes , and no . In versions before 5.0.3, this option had no effect.
Initial Catalog, Database	mysql	The name of the database to use initially
Password, pwd		The password for the MySQL account being used.
Persist Security Info	false	When set to false or no (strongly recommended), security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state. Resetting the connection string resets all connection string values including the password. Recognized values are true , false , yes , and no .
User Id, Username, Uid, User name		The MySQL login account being used.
Shared Memory Name	MYSQL	The name of the shared memory object to use for communication if the connection protocol is set to memory.
Allow Zero Datetime	false	True to have <code>MySqlDataReader.GetValue()</code> return a <code>MySqlDateTime</code> for date or datetime columns that have illegal values. False will cause a <code>System.DateTime</code> object to be returned for legal values and an exception will be thrown for illegal values.
Convert Zero Datetime	false	True to have <code>MySqlDataReader.GetValue()</code> and <code>MySqlDataReader.GetDateTime()</code> return <code>DateTime.MinValue</code> for date or datetime columns that have illegal values.
Old Syntax, OldSyntax	false	Allows use of '@' symbol as a parameter marker. See <code>MySqlCommand</code> for more info. This is for compatibility only. All future code should be written to use the new '?' parameter marker.
Pipe Name, Pipe	mysql	When set to the name of a named pipe, the <code>MySqlConnection</code> will attempt to connect to MySQL on that named pipe. This settings only applies to the Windows platform.
Procedure Cache	25	Sets the size of the stored procedure cache. By default, Connector/NET will store the metadata (input/output datatypes) about the last 25 stored procedures used. To disable the stored procedure cache, set the value to zero (0). This option was added in Connector/NET 5.0.2 and Connector/NET 1.0.9.
Use Procedure Bodies	true	Setting this option to false indicates that the user connecting to the database does not have the <code>SELECT</code> privileges for the <code>mysql.proc</code> (stored procedures) table. When set to false , Connector/NET will not rely on this information being available when the procedure is called. Because Connector/NET will be unable to determine this information, you should explicitly set the types of all the parameters before the call and the parameters should be added to the command in the exact same order as they appear in the procedure definition. This option was added in Connector/NET 5.0.4 and Connector/NET 1.0.10.

The following table lists the valid names for connection pooling values within the `ConnectionString`. For more information about connection pooling, see Connection Pooling for the MySQL Data Provider.

Name	Default	Description
Connection Lifetime	0	When a connection is returned to the pool, its creation time is compared with the current time, and the connection is destroyed if that time span (in seconds) exceeds the value specified by <code>Connection Lifetime</code> . This is useful in clustered configurations to force load balancing between a running server and a server just brought online. A value of zero (0) causes pooled connections to have the maximum connection timeout.
Max Pool Size	100	The maximum number of connections allowed in the pool.

Min Pool Size	0	The minimum number of connections allowed in the pool.
Pooling	true	When true , the MySQLConnection object is drawn from the appropriate pool, or if necessary, is created and added to the appropriate pool. Recognized values are true , false , yes , and no .
Reset Pooled Connections, ResetConnections, ResetPooledConnections	true	Specifies whether a ping and a reset should be sent to the server before a pooled connection is returned. Not resetting will yeild faster connection opens but also will not clear out session items such as temp tables.
Cache Server Configuration, CacheServerConfiguration, CacheServerConfig	false	Specifies whether server variables should be updated when a pooled connection is returned. Turning this one will yeild faster opens but will also not catch any server changes made by other connections.

When setting keyword or connection pooling values that require a Boolean value, you can use 'yes' instead of 'true', and 'no' instead of 'false'.

Note The MySQL Data Provider uses the native socket protocol to communicate with MySQL. Therefore, it does not support the use of an ODBC data source name (DSN) when connecting to MySQL because it does not add an ODBC layer.

CAUTION In this release, the application should use caution when constructing a connection string based on user input (for example when retrieving user ID and password information from a dialog box, and appending it to the connection string). The application should ensure that a user cannot embed extra connection string parameters in these values (for example, entering a password as "validpassword;database=somedb" in an attempt to attach to a different database).

Examples

The following example creates a **MySQLConnection** and sets some of its properties

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySQLConnection()
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect Timeout=30;user id=myUser;password=myPass"
    myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySQLConnection myConnection = new MySQLConnection();
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect Timeout=30;user id=myUser;password=myPass"
    myConnection.Open();
}
```

Examples

The following example creates a **MySQLConnection** in Unix environment with Mono installed. MySQL socket filename used in this example is "/var/lib/mysql/mysql.sock". The actual filename depends on your MySQL configuration.

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySQLConnection()
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwd=myPass"
    myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySQLConnection myConnection = new MySQLConnection();
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwd=myPass";
    myConnection.Open();
}
```

26.2.3.4. Using `MySQLDataAdapter`

Represents a set of data commands and a database connection that are used to fill a dataset and update a MySQL database. This class cannot be inherited.

The `MySQLDataAdapter`, serves as a bridge between a `System.Data.DataSet` and MySQL for retrieving and saving data. The `MySQLDataAdapter` provides this bridge by mapping `DbDataAdapter.Fill`, which changes the data in the `DataSet` to match the data in the data source, and `DbDataAdapter.Update`, which changes the data in the data source to match the data in the `DataSet`, using the appropriate SQL statements against the data source.

When the `MySQLDataAdapter` fills a `DataSet`, it will create the necessary tables and columns for the returned data if they do not already exist. However, primary key information will not be included in the implicitly created schema unless the `System.Data.MissingSchemaAction` property is set to `System.Data.MissingSchemaAction.AddWithKey`. You may also have the `MySQLDataAdapter` create the schema of the `DataSet`, including primary key information, before filling it with data using `System.Data.Common.DbDataAdapter.FillSchema`.

`MySQLDataAdapter` is used in conjunction with `MySQLConnection` and `MySQLCommand` to increase performance when connecting to a MySQL database.

The `MySQLDataAdapter` also includes the `MySQLDataAdapter.SelectCommand`, `MySQLDataAdapter.InsertCommand`, `MySQLDataAdapter.DeleteCommand`, `MySQLDataAdapter.UpdateCommand`, and `DataAdapter.TableMappings` properties to facilitate the loading and updating of data.

When an instance of `MySQLDataAdapter` is created, the read/write properties are set to initial values. For a list of these values, see the `MySQLDataAdapter` constructor.

Note

Please be aware that the `DataColumn` class in .NET 1.0 and 1.1 does not allow columns with type of `UInt16`, `UInt32`, or `UInt64` to be autoincrement columns. If you plan to use autoincrement columns with MySQL, you should consider using signed integer columns.

Examples

The following example creates a `MySQLCommand` and a `MySQLConnection`. The `MySQLConnection` is opened and set as the `MySQLCommand.Connection` for the `MySQLCommand`. The example then calls `MySQLCommand.ExecuteNonQuery`, and closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Function SelectRows(dataset As DataSet, connection As String, query As String) As DataSet
    Dim conn As New MySQLConnection(connection)
    Dim adapter As New MySQLDataAdapter()
    adapter.SelectCommand = new MySQLCommand(query, conn)
    adapter.Fill(dataset)
    Return dataset
End Function
```

C# example:

```
public DataSet SelectRows(DataSet dataset, string connection, string query)
{
    MySQLConnection conn = new MySQLConnection(connection);
    MySQLDataAdapter adapter = new MySQLDataAdapter();
    adapter.SelectCommand = new MySQLCommand(query, conn);
    adapter.Fill(dataset);
    return dataset;
}
```

26.2.3.4.1. Class `MySQLDataAdapter` Constructor

Overload methods for `MySQLDataAdapter`

Initializes a new instance of the `MySQLDataAdapter` class.

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySQLDataAdapter = New MySQLDataAdapter
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.SelectCommand = New MySqlCommand("SELECT id, name FROM mytable", conn)
    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySQLDataAdapter da = new MySQLDataAdapter();
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.SelectCommand = new MySqlCommand("SELECT id, name FROM mytable", conn);
    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

26.2.3.4.2. Class MySQLDataAdapter Constructor Form 1

Initializes a new instance of the [MySQLDataAdapter](#) class with the specified [MySqlCommand](#) as the [SelectCommand](#) property.

Parameters: [MySqlCommand](#) that is a SQL [SELECT](#) statement or stored procedure and is set as the [SelectCommand](#) property of the [MySQLDataAdapter](#).

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

When [SelectCommand](#) (or any of the other command properties) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [SelectCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim cmd As new MySqlCommand("SELECT id, name FROM mytable", conn)
    Dim da As MySQLDataAdapter = New MySQLDataAdapter(cmd)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySqlCommand cmd = new MySqlCommand("SELECT id, name FROM mytable", conn);
    MySQLDataAdapter da = new MySQLDataAdapter(cmd);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

26.2.3.4.3. Class MySQLDataAdapter Constructor Form 2

Initializes a new instance of the [MySQLDataAdapter](#) class with a [SelectCommand](#) and a [MySqlConnection](#) object.

Parameters: A [String](#) that is a SQL [SELECT](#) statement or stored procedure to be used by the [SelectCommand](#) property of the [MySQLDataAdapter](#).

Parameters: A [MySqlConnection](#) that represents the connection.

This implementation of the [MySQLDataAdapter](#) opens and closes a [MySqlConnection](#) if it is not already open. This can be useful in an application that must call the [DbDataAdapter.Fill](#) method for two or more [MySQLDataAdapter](#) objects. If the [MySqlConnection](#) is already open, you must explicitly call [MySqlConnection.Close](#) or [MySqlConnection.Dispose](#) to close it.

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough

MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySqlDataAdapter = New MySqlDataAdapter("SELECT id, name FROM mytable", conn)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySqlDataAdapter da = new MySqlDataAdapter("SELECT id, name FROM mytable", conn);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

26.2.3.4.4. Class MySqlDataAdapter Constructor Form 3

Initializes a new instance of the [MySqlDataAdapter](#) class with a [SelectCommand](#) and a connection string.

Parameters: A [string](#) that is a SQL [SELECT](#) statement or stored procedure to be used by the [SelectCommand](#) property of the [MySqlDataAdapter](#).

Parameters: The connection string

When an instance of [MySqlDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim da As MySQLDataAdapter = New MySQLDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;database=test")
    Dim conn As MySqlConnection = da.SelectCommand.Connection
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySQLDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySQLDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySQLDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySQLDataAdapter da = new MySQLDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;database=test");
    MySqlConnection conn = da.SelectCommand.Connection;
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySQLDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySQLDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySQLDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySQLDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

26.2.3.4.5. DeleteCommand

Gets or sets a SQL statement or stored procedure used to delete records from the data set.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to delete records in the database that correspond to deleted rows in the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [DeleteCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySQLCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySQLCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [DeleteCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [DeleteCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Examples

The following example creates a [MySQLDataAdapter](#) and sets the [SelectCommand](#) and [DeleteCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySQLDataAdapter
    Dim da As MySQLDataAdapter = New MySQLDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15)
```

```

da.SelectCommand = cmd
' Create the DeleteCommand.
cmd = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
parm.SourceVersion = DataRowVersion.Original
da.DeleteCommand = cmd
Return da
End Function

```

C# example:

```

public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the DeleteCommand.
    cmd = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    parm.SourceVersion = DataRowVersion.Original;
    da.DeleteCommand = cmd;
    return da;
}

```

26.2.3.4.6. InsertCommand

Gets or sets a SQL statement or stored procedure used to insert records into the data set.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to insert records into the database that correspond to new rows in the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [InsertCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [InsertCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [InsertCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Note

If execution of this command returns rows, these rows may be added to the [DataSet](#) depending on how you set the [MySqlCommand.UpdatedRowSource](#) property of the [MySqlCommand](#) object.

Examples

The following example creates a [MySqlDataAdapter](#) and sets the [SelectCommand](#) and [InsertCommand](#) properties. It assumes you have already created a [MySqlConnection](#) object.

Visual Basic example:

```

Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add( "?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function

```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}
```

26.2.3.4.7. UpdateCommand

Gets or sets a SQL statement or stored procedure used to updated records in the data source.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to update records in the database with data from the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [UpdateCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [UpdateCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [UpdateCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Note

If execution of this command returns rows, these rows may be merged with the [DataSet](#) depending on how you set the [MySqlCommand.UpdatedRowSource](#) property of the [MySqlCommand](#) object.

Examples

The following example creates a [MySqlDataAdapter](#) and sets the [SelectCommand](#) and [UpdateCommand](#) properties. It assumes you have already created a [MySqlConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the UpdateCommand.
    cmd = New MySqlCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn)
    cmd.Parameters.Add( "?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" )

    parm = cmd.Parameters.Add("?oldId", MySqlDbType.VarChar, 15, "id")
    parm.SourceVersion = DataRowVersion.Original

    da.UpdateCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
```

```

MySQLCommand cmd;
MySQLParameter parm;
// Create the SelectCommand.
cmd = new MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15);
cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15);
da.SelectCommand = cmd;
// Create the UpdateCommand.
cmd = new MySQLCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn);
cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15, "id" );
cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15, "name" );

parm = cmd.Parameters.Add( "?oldId", MySQLDbType.VarChar, 15, "id" );
parm.SourceVersion = DataRowVersion.Original;

da.UpdateCommand = cmd;
return da;
}

```

26.2.3.4.8. SelectCommand

Gets or sets a SQL statement or stored procedure used to select records in the data source.

Value: A [MySQLCommand](#) used during [System.Data.Common.DbDataAdapter.Fill](#) to select records from the database for placement in the [DataSet](#).

When [SelectCommand](#) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [SelectCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

If the [SelectCommand](#) does not return any rows, no tables are added to the [DataSet](#), and no exception is raised.

Examples

The following example creates a [MySQLDataAdapter](#) and sets the [SelectCommand](#) and [InsertCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```

Public Shared Function CreateCustomerAdapter(conn As MySQLConnection) As MySQLDataAdapter

    Dim da As MySQLDataAdapter = New MySQLDataAdapter()
    Dim cmd As MySQLCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySQLCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add( "?id", MySQLDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySQLDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function

```

C# example:

```

public static MySQLDataAdapter CreateCustomerAdapter(MySQLConnection conn)
{
    MySQLDataAdapter da = new MySQLDataAdapter();
    MySQLCommand cmd;
    MySQLParameter parm;
    // Create the SelectCommand.
    cmd = new MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySQLCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}

```

26.2.3.5. Using `MySqlDataReader`

To create a `MySqlDataReader`, you must call the `MySqlCommand.ExecuteReader` method of the `MySqlCommand` object, rather than directly using a constructor.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`, and no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called.

`MySqlDataReader.IsClosed` and `MySqlDataReader.RecordsAffected` are the only properties that you can call after the `MySqlDataReader` is closed. Though the `RecordsAffected` property may be accessed at any time while the `MySqlDataReader` exists, always call `Close` before returning the value of `RecordsAffected` to ensure an accurate return value.

For optimal performance, `MySqlDataReader` avoids creating unnecessary objects or making unnecessary copies of data. As a result, multiple calls to methods such as `MySqlDataReader.GetValue` return a reference to the same object. Use caution if you are modifying the underlying value of the objects returned by methods such as `GetValue`.

Examples

The following example creates a `MySqlConnection`, a `MySqlCommand`, and a `MySqlDataReader`. The example reads through the data, writing it out to the console. Finally, the example closes the `MySqlDataReader`, then the `MySqlConnection`.

Visual Basic example:

```
Public Sub ReadMyData(myConnString As String)
    Dim mySelectQuery As String = "SELECT OrderID, CustomerID FROM Orders"
    Dim myConnection As New MySqlConnection(myConnString)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySqlDataReader
    myReader = myCommand.ExecuteReader()
    ' Always call Read before accessing data.
    While myReader.Read()
        Console.WriteLine((myReader.GetInt32(0) & ", " & myReader.GetString(1)))
    End While
    ' always call Close when done reading.
    myReader.Close()
    ' Close the connection when done with it.
    myConnection.Close()
End Sub 'ReadMyData
```

C# example:

```
public void ReadMyData(string myConnString) {
    string mySelectQuery = "SELECT OrderID, CustomerID FROM Orders";
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySqlDataReader myReader;
    myReader = myCommand.ExecuteReader();
    // Always call Read before accessing data.
    while (myReader.Read()) {
        Console.WriteLine(myReader.GetInt32(0) + ", " + myReader.GetString(1));
    }
    // always call Close when done reading.
    myReader.Close();
    // Close the connection when done with it.
    myConnection.Close();
}
```

26.2.3.5.1. `GetBytes`

`GetBytes` returns the number of available bytes in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if `GetBytes` has already been used to obtain bytes from the field. This may be the case, for example, if the `MySqlDataReader` is reading a large data structure into a buffer. For more information, see the `SequentialAccess` setting for `MySqlCommand.CommandBehavior`.

If you pass a buffer that is a null reference (`Nothing` in Visual Basic), `GetBytes` returns the length of the field in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

26.2.3.5.2. GetTimeSpan

Gets the value of the specified column as a [TimeSpan](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.3. GetDateTime

Gets the value of the specified column as a [System.DateTime](#) object.

Note

MySQL allows date columns to contain the value '0000-00-00' and datetime columns to contain the value '0000-00-00 00:00:00'. The `DateTime` structure cannot contain or represent these values. To read a datetime value from a column that might contain zero values, use [GetMySQLDateTime](#). The behavior of reading a zero datetime column using this method is defined by the [ZeroDateTimeBehavior](#) connection string option. For more information on this option, please refer to [MySQLConnection.ConnectionString](#).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.4. GetMySQLDateTime

Gets the value of the specified column as a [MySQL.Data.Types.MySQLDateTime](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.5. GetString

Gets the value of the specified column as a [String](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.6. GetDecimal

Gets the value of the specified column as a [Decimal](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.7. GetDouble

Gets the value of the specified column as a double-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.8. GetFloat

Gets the value of the specified column as a single-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.9. GetGuid

Gets the value of the specified column as a globally-unique identifier (GUID).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.10. GetInt16

Gets the value of the specified column as a 16-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.11. GetInt32

Gets the value of the specified column as a 32-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.12. GetInt64

Gets the value of the specified column as a 64-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.13. GetUInt16

Gets the value of the specified column as a 16-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.14. GetUInt32

Gets the value of the specified column as a 32-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.5.15. GetUInt64

Gets the value of the specified column as a 64-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

26.2.3.6. Using `MySqlException`

This class is created whenever the MySQL Data Provider encounters an error generated from the server.

Any open connections are not automatically closed when an exception is thrown. If the client application determines that the exception is fatal, it should close any open `MySqlDataReader` objects or `MySqlConnection` objects.

Examples

The following example generates a [MySQLException](#) due to a missing server, and then displays the exception.

Visual Basic example:

```
Public Sub ShowException()  
    Dim mySelectQuery As String = "SELECT column1 FROM table1"  
    Dim myConnection As New MySqlConnection ("Data Source=localhost;Database=Sample;")  
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)  
    Try  
        myCommand.Connection.Open()  
    Catch e As MySQLException  
        MessageBox.Show( e.Message )  
    End Try  
End Sub
```

C# example:

```
public void ShowException()  
{  
    string mySelectQuery = "SELECT column1 FROM table1";  
    MySqlConnection myConnection =  
        new MySqlConnection("Data Source=localhost;Database=Sample;");  
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery,myConnection);  
    try  
    {  
        myCommand.Connection.Open();  
    }  
    catch (MySQLException e)  
    {  
        MessageBox.Show( e.Message );  
    }  
}
```

26.2.3.7. Using [MySQLParameter](#)

Parameter names are not case sensitive.

Examples

The following example creates multiple instances of [MySQLParameter](#) through the [MySQLParameterCollection](#) collection within the [MySQLDataAdapter](#). These parameters are used to select data from the data source and place the data in the [DataSet](#). This example assumes that a [DataSet](#) and a [MySQLDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddSqlParameters()  
    ' ...  
    ' create myDataSet and myDataAdapter  
    ' ...  
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters"  
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239  
    myDataAdapter.Fill(myDataSet)  
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()  
{  
    // ...  
    // create myDataSet and myDataAdapter  
    // ...  
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters";  
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239;  
    myDataAdapter.Fill(myDataSet);  
}
```

26.2.3.8. Using [MySQLParameterCollection](#)

The number of the parameters in the collection must be equal to the number of parameter placeholders within the command text, or an exception will be generated.

Examples

The following example creates multiple instances of [MySQLParameter](#) through the [MySQLParameterCollection](#) collection within the [MySQLDataAdapter](#). These parameters are used to select data within the data source and place the data in the [DataSet](#). This code assumes that a [DataSet](#) and a [MySQLDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239
    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters";
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

26.2.3.9. Using [MySQLTransaction](#)

Represents a SQL transaction to be made in a MySQL database. This class cannot be inherited.

The application creates a [MySQLTransaction](#) object by calling [MySQLConnection.BeginTransaction](#) on the [MySQLConnection](#) object. All subsequent operations associated with the transaction (for example, committing or aborting the transaction), are performed on the [MySQLTransaction](#) object.

Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [MySQLConnection.BeginTransaction](#), [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySQLException
```

```

        If Not myTrans.Connection Is Nothing Then
            Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                " was encountered while attempting to roll back the transaction.")
        End If
    End Try

    Console.WriteLine("An exception of type " & e.GetType().ToString() & _
        " was encountered while inserting the data.")
    Console.WriteLine("Neither record was written to database.")
Finally
    myConnection.Close()
End Try
End Sub 'RunTransaction

```

C# example:

```

public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch (Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

26.2.3.9.1. Rollback

Rolls back a transaction from a pending state.

The Rollback method is equivalent to the MySQL statement ROLLBACK. The transaction can only be rolled back from a pending state (after BeginTransaction has been called, but before Commit is called).

Examples

The following example creates [MySqlConnection](#) and a [MySqlTransaction](#). It also demonstrates how to use the [MySqlConnection.BeginTransaction](#), [Commit](#), and [Rollback](#) methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

```

```

Dim myCommand As MySqlCommand = myConnection.CreateCommand()
Dim myTrans As MySqlTransaction

' Start a local transaction
myTrans = myConnection.BeginTransaction()

' Must assign both transaction object and connection
' to Command object for a pending local transaction
myCommand.Connection = myConnection
myCommand.Transaction = myTrans

Try
    myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
    myCommand.ExecuteNonQuery()
    myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
    myCommand.ExecuteNonQuery()
    myTrans.Commit()
    Console.WriteLine("Success.")
Catch e As Exception
    Try
        myTrans.Rollback()
    Catch ex As MySqlException
        If Not myTrans.Connection Is Nothing Then
            Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                " was encountered while attempting to roll back the transaction.")
        End If
    End Try

    Console.WriteLine("An exception of type " & e.GetType().ToString() & _
        " was encountered while inserting the data.")
    Console.WriteLine("Neither record was written to database.")
Finally
    myConnection.Close()
End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch (Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

26.2.3.9.2. Commit

Commits the database transaction.

The [Commit](#) method is equivalent to the MySQL SQL statement COMMIT.

Examples

The following example creates [MySqlConnection](#) and a [MySqlTransaction](#). It also demonstrates how to use the [MySqlConnection.BeginTransaction](#), [Commit](#), and [Rollback](#) methods.

Visual Basic example:

```
Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub
```

C# example:

```
public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
        }
    }
}
```

```

    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

26.2.4. Connector/NET Reference

This section of the manual contains a complete reference to the Connector/NET ADO.NET component, automatically generated from the embedded documentation.

26.2.4.1. `MySql.Data.MySqlClient`

[Namespace hierarchy](#)

Classes

Class	Description
 MySqlCommand 	
 MySqlCommandBuilder 	
 MySqlConnection 	
 MySqlDataAdapter 	
 MySqlDataReader 	Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.
 MySqlError 	Collection of error codes that can be returned by the server
 MySqlException 	The exception that is thrown when MySQL returns an error. This class cannot be inherited.
 MySqlHelper 	Helper class that makes it easier to work with the provider.
 MySqlInfoMessageEventArgs 	Provides data for the InfoMessage event. This class cannot be inherited.
 MySqlParameter 	Represents a parameter to a MySqlCommand , and optionally, its mapping to DataSet columns. This class cannot be inherited.
 MySqlParameterCollection 	Represents a collection of parameters relevant to a MySqlCommand as well as their respective mappings to columns in a DataSet. This class cannot be inherited.
 MySqlRowUpdatedEventArgs 	Provides data for the RowUpdated event. This class cannot be inherited.
 MySqlRowUpdatingEventArgs 	Provides data for the RowUpdating event. This class cannot be inherited.
 MySqlTransaction 	

Delegates

Delegate	Description
 MySqlInfoMessageEventHandler 	Represents the method that will handle the InfoMessage event of a MySqlConnection .
 MySqlRowUpdatedEventHandler 	Represents the method that will handle the RowUpdated event of a MySqlDataAdapter .

MySqlRowUpdatingEventHandler	Represents the method that will handle the RowUpdatingevent of a MySqlDataAdapter .

Enumerations

Enumeration	Description
MySqlDbType	Specifies MySQL specific data type of a field, property, for use in a MySqlParameter .
MySqlErrorCode

[MySQLCommand overview](#)

Public Instance Constructors

MySQLCommand	Overloaded. Initializes a new instance of the MySqlCommand class.

Public Instance Properties

CommandText	
CommandTimeout	
CommandType	

Connection	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
IsPrepared	
Parameters	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
Transaction	
UpdatedRowSource	

Public Instance Methods

Cancel	Attempts to cancel the execution of a MySqlCommand. This operation is not supported.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
CreateParameter	Creates a new instance of a MySqlParameter object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
ExecuteNonQuery	
ExecuteReader	Overloaded.
ExecuteScalar	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Prepare	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposedevent on the component.

[MySQLConnection overview](#)

Public Instance Constructors

MySQLConnection	Overloaded. Initializes a new instance of the MySqlConnection class.

Public Instance Properties

ConnectionString	
ConnectionTimeout	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
Database	
DataSource	Gets the name of the MySQL server to which to connect.
ServerThread	Returns the id of the server thread this connection is executing on
ServerVersion	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
State	
UseCompression	Indicates if this connection should use compression when communicating with the server.

Public Instance Methods

BeginTransaction	Overloaded.
ChangeDatabase	
Close	
CreateCommand	
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information re-

	quired to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.

Ping	Ping
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
InfoMessage	
StateChange

26.2.4.1.2.1.1.3.1.1.10.1.1. [MySQLTransaction](#) Class

For a list of all members of this type, see [MySQLTransaction Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLTransaction_
    Implements IDbTransaction, IDisposable
```

Syntax: C#

```
public sealed class MySQLTransaction : IDbTransaction, IDisposable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySQLClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLTransaction Members](#) , [MySQL.Data.MySQLClient Namespace](#)

26.2.4.1.2.1.1.3.1.1.10.1.1.1.1. MySQLTransaction Members

[MySQLTransaction overview](#)

Public Instance Properties

Connection	Gets the MySQLConnection object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.
IsolationLevel	Specifies the IsolationLevel for this transaction.

Public Instance Methods

Commit	
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
Rollback	
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLTransaction Class](#) , [MySQL.Data.MySQLClient Namespace](#)

26.2.4.1.2.1.1.3.1.1.10.1.1.1.1.1. Connection Property

Gets the [MySQLConnection](#) object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.

Syntax: Visual Basic

```
Public ReadOnly Property Connection As MySqlConnection
```

Syntax: C#

```
public MySqlConnection Connection {get;}
```

Property Value

The [MySqlConnection](#) object associated with this transaction.

Remarks

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by [BeginTransaction](#).

See Also

[MySqlTransaction Class](#), [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.1.3.1.1.10.1.1.1.2. IsolationLevel Property

Specifies the IsolationLevel for this transaction.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsolationLevel As IsolationLevel _  
    Implements IDbTransaction.IsolationLevel
```

Syntax: C#

```
public System.Data.IsolationLevel IsolationLevel {get;}
```

Property Value

The IsolationLevel for this transaction. The default is ReadCommitted.

Implements

IDbTransaction.IsolationLevel

Remarks

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

[MySqlInfoMessageEventArgs](#) overview

Public Instance Constructors

MySqlInfoMessageEventArgs Constructor	Initializes a new instance of the MySqlInfoMessageEventArgs class.

Public Instance Fields

errors	

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

26.2.4.1.2.1.7.1. [MySqlParameterCollection](#) Class

Represents a collection of parameters relevant to a [MySqlCommand](#) as well as their respective mappings to columns in a DataSet. This class cannot be inherited.

For a list of all members of this type, see [MySqlParameterCollection Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlConnection_  
    Inherits MarshalByRefObject_  
    Implements IDataParameterCollection, IList, ICollection, IEnumerable
```

Syntax: C#

```
public sealed class MySqlConnection : MarshalByRefObject, IDataParameterCollection, IList, ICollection, IEnumerable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLParameterCollection Members](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1. MySQLParameterCollection Members

[MySQLParameterCollection overview](#)

Public Instance Constructors

MySQLParameterCollection Constructor	Initializes a new instance of the MySQLParameterCollection class.

Public Instance Properties

Count	Gets the number of MySQLParameter objects in the collection.
Item	Overloaded. Gets the MySQLParameter with a specified attribute. In C#, this property is the indexer for the MySQLParameterCollection class.

Public Instance Methods

Add	Overloaded. Adds the specified MySQLParameter object to the MySQLParameterCollection .
Clear	Removes all items from the collection.
Contains	Overloaded. Gets a value indicating whether a MySQLParameter exists in the collection.
CopyTo	Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
IndexOf	Overloaded. Gets the location of a MySQLParameter in the collection.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Insert	Inserts a MySQLParameter into the collection at the specified index.
Remove	Removes the specified MySQLParameter from the collection.

RemoveAt	Overloaded. Removes the specified MySQLParameter from the collection.
ToString (inherited from Object)	Returns a String that represents the current Object.

26.2.4.1.2.1.7.1.1.1. [MySQLParameterCollection](#) Constructor

Initializes a new instance of the [MySQLParameterCollection](#) class.

Syntax: Visual Basic

```
Public Sub New()
```

Syntax: C#

```
public MySQLParameterCollection();
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.2. Count Property

Gets the number of [MySQLParameter](#) objects in the collection.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Count As Integer _  
    Implements ICollection.Count
```

Syntax: C#

```
public int Count {get;}
```

Implements

ICollection.Count

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3. Item Property

Gets the [MySQLParameter](#) with a specified attribute. In C#, this property is the indexer for the [MySQLParameterCollection](#) class.

Overload List

Gets the [MySQLParameter](#) at the specified index.

- [public MySQLParameter this\[int\] {get; set;}](#)

Gets the [MySQLParameter](#) with the specified name.

- [public MySQLParameter this\[string\] {get; set;}](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1. [MySQLParameter](#) Class

Represents a parameter to a [MySQLCommand](#) , and optionally, its mapping to DataSetcolumns. This class cannot be inherited.

For a list of all members of this type, see [MySQLParameter Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLParameter_
    Inherits MarshalByRefObject_
    Implements IDataParameter, IDbDataParameter, ICloneable
```

Syntax: C#

```
public sealed class MySQLParameter : MarshalByRefObject, IDataParameter, IDbDataParameter, ICloneable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

26.2.4.1.2.1.7.1.1.3.1.1. [MySQLParameter](#) Members

[MySQLParameter overview](#)

Public Instance Constructors

MySQLParameter	Overloaded. Initializes a new instance of the MySQLParameter class.

Public Instance Properties

DbType	Gets or sets the DbType of the parameter.
Direction	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.
IsNullable	Gets or sets a value indicating whether the parameter accepts null values.
IsUnsigned	
MySQLDbType	Gets or sets the MySQLDbType of the parameter.
ParameterName	Gets or sets the name of the MySQLParameter.
Precision	Gets or sets the maximum number of digits used to represent the Value property.
Scale	Gets or sets the number of decimal places to which Value is resolved.

Size	Gets or sets the maximum size, in bytes, of the data within the column.
SourceColumn	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the Value .
SourceVersion	Gets or sets the DataRowVersion to use when loading Value .
Value	Gets or sets the value of the parameter.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ToString	Overridden. Gets a string containing the ParameterName .

26.2.4.1.2.1.7.1.1.3.1.1.1. [MySQLParameter](#) Constructor

Initializes a new instance of the MySQLParameter class.

Overload List

Initializes a new instance of the MySQLParameter class.

- [public MySQLParameter\(\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

- [public MySQLParameter\(string, MySQLDbType\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , and the size.

- [public MySQLParameter\(string, MySQLDbType, int\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a ParameterDirection, the precision of the parameter, the scale of the parameter, the source column, a DataRowVersion to use, and the value of the parameter.

- [public MySQLParameter\(string, MySQLDbType, int, ParameterDirection, bool, byte, byte, string, DataRowVersion, object\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

- [public MySQLParameter\(string,MySQLDbType,int,string\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new MySQLParameter.

- [public MySQLParameter\(string,object\);](#)

26.2.4.1.2.1.7.1.1.3.1.1.1.2. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Sub New( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySQLDbType _  
)
```

Syntax: C#

```
public MySQLParameter(  
    stringparameterName,  
    MySQLDbTypedbType  
);
```

Parameters

- [parameterName](#): The name of the parameter to map.
- [dbType](#): One of the [MySQLDbType](#) values.

26.2.4.1.2.1.7.1.1.3.1.1.1.2.1. [MySQLDbType](#) Enumeration

Specifies MySQL specific data type of a field, property, for use in a [MySQLParameter](#) .

Syntax: Visual Basic

```
Public Enum MySqlDbType
```

Syntax: C#

```
public enum MySqlDbType
```

Members

Member Name	Description
VarChar	A variable-length string containing 0 to 65535 characters
Timestamp	A timestamp. The range is '1970-01-01 00:00:01' to sometime in the year 2038
LongBlob	A BLOB or TEXT column with a maximum length of 4294967295 or 4G (2 ³² - 1) characters
Time	The range is '-838:59:59' to '838:59:59'.
TinyBlob	A BLOB or TEXT column with a maximum length of 255 (2 ⁸ - 1) characters
Datetime	The supported range is '1000-01-01 00:00:00' to '9999-12-31 23:59:59'.
Decimal	A fixed precision and scale numeric value between -1038 -1 and 10 38 -1.
UByte	
Blob	A BLOB or TEXT column with a maximum length of 65535 (2 ¹⁶ - 1) characters
Double	A normal-size (double-precision) floating-point number. Allowable values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308.
Newdate	Obsolete Use Datetime or Date type
Byte	The signed range is -128 to 127. The unsigned range is 0 to 255.
Date	Date The supported range is '1000-01-01' to '9999-12-31'.
VarChar	A variable-length string containing 0 to 255 characters
UInt16	
UInt24	
Int16	A 16-bit signed integer. The signed range is -32768 to 32767. The unsigned range is 0 to 65535
NewDecimal	New Decimal
Set	A set. A string object that can have zero or more values, each of which must be chosen from the list of values 'value1', 'value2', ... A SET can have a maximum of 64 members.
String	Obsolete Use VarChar type
Enum	An enumeration. A string object that can have only one value, chosen from the list of values 'value1', 'value2', ..., NULL or the special "" error value. An ENUM can have a maximum of 65535 distinct values
Geometry	
UInt64	

Int64	A 64-bit signed integer.
UInt32	
Int24	Specifies a 24 (3 byte) signed or unsigned value.
Bit	Bit-field data type
Float	A small (single-precision) floating-point number. Allowable values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38.
Year	A year in 2- or 4-digit format (default is 4-digit). The allowable values are 1901 to 2155, 0000 in the 4-digit year format, and 1970-2069 if you use the 2-digit format (70-69)
Int32	A 32-bit signed integer
MediumBlob	A BLOB or TEXT column with a maximum length of 16777215 (2 ²⁴ - 1) characters

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.3. [MySQLParameter](#) Constructor (String, MySqlDbType, Int32)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySqlDbType](#), and the size.

Syntax: Visual Basic

```
Overloads Public Sub New(
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
)
```

Syntax: C#

```
public MySQLParameter(
    string parameterName,
    MySqlDbType dbType,
    int size
);
```

Parameters

- **parameterName**: The name of the parameter to map.
- **dbType**: One of the [MySqlDbType](#) values.
- **size**: The length of the parameter.

See Also

[MySQLParameter Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySQLParameter Constructor Overload List](#)

26.2.4.1.2.1.7.1.1.3.1.1.4. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal direction As ParameterDirection, _
    ByVal isNullable As Boolean, _
    ByVal precision As Byte, _
    ByVal scale As Byte, _
    ByVal sourceColumn As String, _
    ByVal sourceVersion As DataRowVersion, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySQLParameter(
    string parameterName,
    MySqlDbType dbType,
    int size,
    ParameterDirection direction,
    bool isNullable,
    byte precision,
    byte scale,
    string sourceColumn,
    DataRowVersion sourceVersion,
    object value
);
```

Parameters

- **parameterName**: The name of the parameter to map.
- **dbType**: One of the [MySQLDbType](#) values.
- **size**: The length of the parameter.
- **direction**: One of the [ParameterDirection](#) values.
- **isNullable**: true if the value of the field can be null, otherwise false.
- **precision**: The total number of digits to the left and right of the decimal point to which [Value](#) is resolved.
- **scale**: The total number of decimal places to which [Value](#) is resolved.
- **sourceColumn**: The name of the source column.
- **sourceVersion**: One of the [DataRowVersion](#) values.
- **value**: An [Object](#) that is the value of the [MySQLParameter](#).

Exceptions

Exception Type	Condition
ArgumentException

[MySQLParameter Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySQLParameter Constructor Overload List](#)

26.2.4.1.2.1.7.1.1.3.1.1.1.4.1. Value Property

Gets or sets the value of the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property Value As Object _  
    Implements IDataParameter.Value
```

Syntax: C#

```
public object Value {get; set;}
```

Implements

IDataParameter.Value

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.5. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

Syntax: Visual Basic

```
Overloads Public Sub New(  
    ByVal parameterName As String, _  
    ByVal dbType As MySQLDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
)
```

Syntax: C#

```
public MySQLParameter(  
    stringparameterName,  
    MySQLDbTypedbType,  
    intsize,  
    stringsourceColumn  
);
```

Parameters

- [parameterName](#): The name of the parameter to map.
- [dbType](#): One of the [MySQLDbType](#) values.
- [size](#): The length of the parameter.
- [sourceColumn](#): The name of the source column.

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

26.2.4.1.2.1.7.1.1.3.1.1.6. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new MySQLParameter.

Syntax: Visual Basic

```
Overloads Public Sub New(  
    ByVal parameterName As String, _  
    ByVal value As Object _  
)
```

Syntax: C#

```
public MySqlParameter(  
    string parameterName,  
    object value  
)
```

Parameters

- **parameterName**: The name of the parameter to map.
- **value**: An Object that is the value of the [MySqlParameter](#).

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameter Constructor Overload List](#)

26.2.4.1.2.1.7.1.1.3.1.1.2. DbType Property

Gets or sets the DbType of the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property DbType As DbType _  
    Implements IDataParameter.DbType
```

Syntax: C#

```
public System.Data.DbType DbType {get; set;}
```

Implements

IDataParameter.DbType

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.3. Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.

Syntax: Visual Basic

```
NotOverridable Public Property Direction As ParameterDirection _  
    Implements IDataParameter.Direction
```

Syntax: C#

```
public System.Data.ParameterDirection Direction {get; set;}
```

Implements

IDataParameter.Direction

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.4. IsNullable Property

Gets or sets a value indicating whether the parameter accepts null values.

Syntax: Visual Basic

```
NotOverridable Public Property IsNullable As Boolean _  
    Implements IDataParameter.IsNullable
```

Syntax: C#

```
public bool IsNullable {get; set;}
```

Implements

IDataParameter.IsNullable

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.5. IsUnsigned Property

Syntax: Visual Basic

```
Public Property IsUnsigned As Boolean
```

Syntax: C#

```
public bool IsUnsigned {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.6. MySQLDbType Property

Gets or sets the MySQLDbType of the parameter.

Syntax: Visual Basic

```
Public Property MySQLDbType As MySQLDbType
```

Syntax: C#

```
public MySQLDbType MySQLDbType {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.7. ParameterName Property

Gets or sets the name of the MySQLParameter.

Syntax: Visual Basic

```
NotOverridable Public Property ParameterName As String _  
    Implements IDataParameter.ParameterName
```

Syntax: C#

```
public string ParameterName {get; set;}
```

Implements

IDataParameter.ParameterName

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.8. Precision Property

Gets or sets the maximum number of digits used to represent the [Value](#) property.

Syntax: Visual Basic

```
NotOverridable Public Property Precision As Byte _  
    Implements IDbDataParameter.Precision
```

Syntax: C#

```
public byte Precision {get; set;}
```

Implements

IDbDataParameter.Precision

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.9. Scale Property

Gets or sets the number of decimal places to which [Value](#) is resolved.

Syntax: Visual Basic

```
NotOverridable Public Property Scale As Byte _  
    Implements IDbDataParameter.Scale
```

Syntax: C#

```
public byte Scale {get; set;}
```

Implements

IDbDataParameter.Scale

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.10. Size Property

Gets or sets the maximum size, in bytes, of the data within the column.

Syntax: Visual Basic

```
NotOverridable Public Property Size As Integer _  
    Implements IDbDataParameter.Size
```

Syntax: C#

```
public int Size {get; set;}
```

Implements

IDbDataParameter.Size

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.11. SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceColumn As String _  
    Implements IDataParameter.SourceColumn
```

Syntax: C#

```
public string SourceColumn {get; set;}
```

Implements

IDataParameter.SourceColumn

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.1.1.12. SourceVersion Property

Gets or sets the DataRowVersion to use when loading [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceVersion As DataRowVersion _  
    Implements IDataParameter.SourceVersion
```

Syntax: C#

```
public System.Data.DataRowVersion SourceVersion {get; set;}
```

Implements

IDataParameter.SourceVersion

See Also[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)26.2.4.1.2.1.7.1.1.3.1.1.13. [MySQLParameter.ToString](#) Method

Overridden. Gets a string containing the [ParameterName](#) .

Syntax: Visual Basic

```
Overrides Public Function ToString() As String
```

Syntax: C#

```
public override string ToString();
```

Return Value

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.3.2. Item Property (Int32)

Gets the [MySQLParameter](#) at the specified index.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
    ByVal index As Integer _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter this[  
    int index  
] {get; set;}
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

26.2.4.1.2.1.7.1.1.3.3. Item Property (String)

Gets the [MySQLParameter](#) with the specified name.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
    ByVal name As String _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter this[  
    string name  
] {get; set;}
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

26.2.4.1.2.1.7.1.1.4. Add Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Overload List

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- [public MySQLParameter Add\(MySQLParameter\);](#)

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- [public int Add\(object\);](#)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

- [public MySQLParameter Add\(string,MySQLDbType\);](#)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, and the column length.

- `public MySQLParameter Add(string,MySQLDbType,int);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

- `public MySQLParameter Add(string,MySQLDbType,int,string);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

- `public MySQLParameter Add(string,object);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.4.1. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal value As MySQLParameter _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    MySQLParametervalue  
);
```

Parameters

- **value**: The [MySQLParameter](#) to add to the collection.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

26.2.4.1.2.1.7.1.1.4.2. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Add( _  
    ByVal value As Object _  
) As Integer _  
    Implements IList.Add
```

Syntax: C#

```
public int Add(  

```

```
objectvalue  
);
```

Parameters

- **value**: The [MySQLParameter](#) to add to the collection.

Return Value

The index of the new [MySQLParameter](#) object.

Implements

[IList.Add](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

26.2.4.1.2.1.7.1.1.4.3. [MySQLParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType  
);
```

Parameters

- **parameterName**: The name of the parameter.
- **dbType**: One of the [MySQLDbType](#) values.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

26.2.4.1.2.1.7.1.1.4.4. [MySQLParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, and the column length.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer _  
) As MySQLParameter
```

Syntax: C#

```
public MySqlParameter Add(  
    string parameterName,  
    MySqlDbType dbType,  
    int size  
);
```

Parameters

- **parameterName**: The name of the parameter.
- **dbType**: One of the [MySqlDbType](#) values.
- **size**: The length of the column.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

26.2.4.1.2.1.7.1.1.4.5. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(  
    string parameterName,  
    MySqlDbType dbType,  
    int size,  
    string sourceColumn  
);
```

Parameters

- **parameterName**: The name of the parameter.
- **dbType**: One of the [MySqlDbType](#) values.
- **size**: The length of the column.
- **sourceColumn**: The name of the source column.

Return Value

The newly added [MySqlParameter](#) object.

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

26.2.4.1.2.1.7.1.1.4.6. [MySqlParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal value As Object _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    string parameterName,  
    object value  
);
```

Parameters

- **parameterName**: The name of the parameter.
- **value**: The **Value** of the [MySQLParameter](#) to add to the collection.

Return Value

The newly added [MySQLParameter](#) object.

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.6. Contains Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Overload List

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

- **public bool Contains(object);**

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

- `public bool Contains(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.6.1. [MySQLParameterCollection.Contains](#) Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _  
    ByVal value As Object _  
) As Boolean _  
    Implements IList.Contains
```

Syntax: C#

```
public bool Contains(  
    objectvalue  
);
```

Parameters

- **value**: The value of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the [MySQLParameter](#) object; otherwise, false.

Implements

[IList.Contains](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

26.2.4.1.2.1.7.1.1.6.2. [MySQLParameterCollection.Contains](#) Method

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _  
    ByVal name As String _  
) As Boolean _  
    Implements IDataParameterCollection.Contains
```

Syntax: C#

```
public bool Contains(  
    stringname  
);
```

Parameters

- **name**: The name of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the parameter; otherwise, false.

Implements

IDataParameterCollection.Contains

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

26.2.4.1.2.1.7.1.1.7. [MySQLParameterCollection.CopyTo](#) Method

Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.

Syntax: Visual Basic

```
NotOverridable Public Sub CopyTo( _  
    ByVal array As Array, _  
    ByVal index As Integer _  
) _  
    Implements ICollection.CopyTo
```

Syntax: C#

```
public void CopyTo(  
    Arrayarray,  
    intindex  
);
```

Parameters

- [array](#):
- [index](#):

Implements

ICollection.CopyTo

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.8. [IndexOf](#) Method

Gets the location of a [MySQLParameter](#) in the collection.

Overload List

Gets the location of a [MySQLParameter](#) in the collection.

- [public int IndexOf\(object\);](#)

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

- [public int IndexOf\(string\);](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.8.1. [MySQLParameterCollection.IndexOf](#) Method

Gets the location of a [MySQLParameter](#) in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal value As Object _  
) As Integer _  
    Implements IList.IndexOf
```

Syntax: C#

```
public int IndexOf(  
    objectvalue  
);
```

Parameters

- **value**: The [MySQLParameter](#) object to locate.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

[IList.IndexOf](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

26.2.4.1.2.1.7.1.1.8.2. [MySQLParameterCollection.IndexOf](#) Method

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal parameterName As String _  
) As Integer _  
    Implements IDataParameterCollection.IndexOf
```

Syntax: C#

```
public int IndexOf(  
    stringparameterName  
);
```

Parameters

- **parameterName**: The name of the [MySQLParameter](#) object to retrieve.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

[IDataParameterCollection.IndexOf](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

26.2.4.1.2.1.7.1.1.9. [MySQLParameterCollection.Insert](#) Method

Inserts a `MySQLParameter` into the collection at the specified index.

Syntax: Visual Basic

```
NotOverridable Public Sub Insert( _  
    ByVal index As Integer, _  
    ByVal value As Object _  
) _  
    Implements IList.Insert
```

Syntax: C#

```
public void Insert(  
    int index,  
    object value  
);
```

Parameters

- `index`:
- `value`:

Implements

`IList.Insert`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.10. [MySQLParameterCollection.Remove](#) Method

Removes the specified `MySQLParameter` from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Remove( _  
    ByVal value As Object _  
) _  
    Implements IList.Remove
```

Syntax: C#

```
public void Remove(  
    object value  
);
```

Parameters

- `value`:

Implements

`IList.Remove`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.11. RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection.

Overload List

Removes the specified [MySQLParameter](#) from the collection using a specific index.

- [public void RemoveAt\(int\);](#)

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

- [public void RemoveAt\(string\);](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.7.1.1.11.1. MySQLParameterCollection.RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection using a specific index.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal index As Integer _  
) _  
    Implements IList.RemoveAt
```

Syntax: C#

```
public void RemoveAt(  
    int index  
);
```

Parameters

- [index](#): The zero-based index of the parameter.

Implements

IList.RemoveAt

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

26.2.4.1.2.1.7.1.1.11.2. MySQLParameterCollection.RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal name As String _  
) _  
    Implements IDataParameterCollection.RemoveAt
```

Syntax: C#

```
public void RemoveAt(  
    stringname  
);
```

Parameters

- **name**: The name of the [MySQLParameter](#) object to retrieve.

Implements

IDataParameterCollection.RemoveAt

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

26.2.4.1.2.1.8. Transaction Property

Syntax: Visual Basic

```
Public Property Transaction As MySqlConnection
```

Syntax: C#

```
public MySqlConnection Transaction {get; set;}
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.9. UpdatedRowSource Property

Syntax: Visual Basic

```
NotOverridable Public Property UpdatedRowSource As UpdateRowSource _  
    Implements IDbCommand.UpdatedRowSource
```

Syntax: C#

```
public System.Data.UpdateRowSource UpdatedRowSource {get; set;}
```

Implements

IDbCommand.UpdatedRowSource

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.10. [MySQLCommand.Cancel](#) Method

Attempts to cancel the execution of a MySqlCommand. This operation is not supported.

Syntax: Visual Basic

```
NotOverridable Public Sub Cancel() _  
    Implements IDbCommand.Cancel
```

Syntax: C#

```
public void Cancel();
```

Implements

IDbCommand.Cancel

Remarks

Cancelling an executing command is currently not supported on any version of MySQL.

Exceptions

Exception Type	Condition
NotSupportedException	This operation is not supported.

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.11. MySqlCommand.CreateParameter Method

Creates a new instance of a [MySqlParameter](#) object.

Syntax: Visual Basic

```
Public Function CreateParameter() As MySqlParameter
```

Syntax: C#

```
public MySqlParameter CreateParameter();
```

Return Value

A [MySqlParameter](#) object.

Remarks

This method is a strongly-typed version of CreateParameter.

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.12. MySqlCommand.ExecuteNonQuery Method

Syntax: Visual Basic

```
NotOverridable Public Function ExecuteNonQuery() As Integer _  
    Implements IDbCommand.ExecuteNonQuery
```

Syntax: C#

```
public int ExecuteNonQuery();
```

Implements

IDbCommand.ExecuteNonQuery

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13. ExecuteReader Method

Overload List

- [public MySqlDataReader ExecuteReader\(\);](#)
- [public MySqlDataReader ExecuteReader\(CommandBehavior\);](#)

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1. MySqlCommand.ExecuteReader Method

Syntax: Visual Basic

```
Overloads Public Function ExecuteReader() As MySqlDataReader
```

Syntax: C#

```
public MySqlDataReader ExecuteReader();
```

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlCommand.ExecuteReader Overload List](#)

26.2.4.1.2.1.13.1.1. MySqlDataReader Class

Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.

For a list of all members of this type, see [MySqlDataReader Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlDataReader_  
    Inherits MarshalByRefObject_  
    Implements IEnumerable, IDataReader, IDisposable, IDataRecord
```

Syntax: C#

```
public sealed class MySqlDataReader : MarshalByRefObject, IEnumerable, IDataReader, IDisposable, IDataRecord
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlDataReader Members](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1. MySqlDataReader Members

[MySqlDataReader overview](#)

Public Instance Properties

Depth	Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.
FieldCount	Gets the number of columns in the current row.
HasRows	Gets a value indicating whether the MySQLDataReader contains one or more rows.
IsClosed	Gets a value indicating whether the data reader is closed.
Item	Overloaded. Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Public Instance Methods

Close	Closes the MySQLDataReader object.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBoolean	Gets the value of the specified column as a Boolean.
GetByte	Gets the value of the specified column as a byte.
GetBytes	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.
GetChar	Gets the value of the specified column as a single character.
GetChars	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
GetDataTypeName	Gets the name of the source data type.
GetDateTime	
GetDecimal	
GetDouble	
GetFieldType	Gets the Type that is the data type of the object.
GetFloat	
GetGuid	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInt16	
GetInt32	
GetInt64	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetMySQLDateTime	
GetName	Gets the name of the specified column.
GetOrdinal	Gets the column ordinal, given the name of the column.
GetSchemaTable	Returns a DataTable that describes the column metadata of the MySQLDataReader.
GetString	
GetTimeSpan	

GetType(inherited from Object)	Gets the Type of the current instance.
GetUInt16	
GetUInt32	
GetUInt64	
GetValue	Gets the value of the specified column in its native format.
GetValues	Gets all attribute columns in the collection for the current row.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
IsDBNull	Gets a value indicating whether the column contains non-existent or missing values.
NextResult	Advances the data reader to the next result, when reading the results of batch SQL statements.
Read	Advances the MySQLDataReader to the next record.
ToString(inherited from Object)	Returns a String that represents the current Object.

26.2.4.1.2.1.13.1.1.1.1. Depth Property

Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Depth As Integer _
    Implements IDataReader.Depth
```

Syntax: C#

```
public int Depth {get;}
```

Implements

IDataReader.Depth

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.2. FieldCount Property

Gets the number of columns in the current row.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property FieldCount As Integer _
    Implements IDataRecord.FieldCount
```

Syntax: C#

```
public int FieldCount {get;}
```

Implements

IDataRecord.FieldCount

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.3. HasRows Property

Gets a value indicating whether the MySQLDataReader contains one or more rows.

Syntax: Visual Basic

```
Public ReadOnly Property HasRows As Boolean
```

Syntax: C#

```
public bool HasRows {get;}
```

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.4. IsClosed Property

Gets a value indicating whether the data reader is closed.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsClosed As Boolean _  
    Implements IDataReader.IsClosed
```

Syntax: C#

```
public bool IsClosed {get;}
```

Implements

IDataReader.IsClosed

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.5. Item Property

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

Overload List

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[int\] {get;}](#)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[string\] {get;}](#)

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.5.1. Item Property (Int32)

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _  
    ByVal i As Integer _  
) _  
- Implements IDataRecord.Item As Object _  
- Implements IDataRecord.Item
```

Syntax: C#

```
public object this[  
    inti  
] {get;}
```

Implements

`IDataRecord.Item`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlDataReader.Item Overload List](#)

26.2.4.1.2.1.13.1.1.1.5.2. Item Property (String)

Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _  
    ByVal name As String _  
) _  
- Implements IDataRecord.Item As Object _  
- Implements IDataRecord.Item
```

Syntax: C#

```
public object this[  
    stringname  
] {get;}
```

Implements

`IDataRecord.Item`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlDataReader.Item Overload List](#)

26.2.4.1.2.1.13.1.1.1.6. RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property RecordsAffected As Integer _  
- Implements IDataReader.RecordsAffected
```

Syntax: C#

```
public int RecordsAffected {get;}
```

Implements

IDataReader.RecordsAffected

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)**26.2.4.1.2.1.13.1.1.7. [MySqlDataReader.Close](#) Method**

Closes the MySqlDataReader object.

Syntax: Visual Basic

```
NotOverridable Public Sub Close() _  
    Implements IDataReader.Close
```

Syntax: C#

```
public void Close();
```

Implements

IDataReader.Close

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)**26.2.4.1.2.1.13.1.1.8. [MySqlDataReader.GetBoolean](#) Method**

Gets the value of the specified column as a Boolean.

Syntax: Visual Basic

```
NotOverridable Public Function GetBoolean( _  
    ByVal i As Integer _  
) As Boolean _  
    Implements IDataRecord.GetBoolean
```

Syntax: C#

```
public bool GetBoolean(  
    inti  
);
```

Parameters

- [i](#):

Return Value**Implements**

IDataRecord.GetBoolean

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)**26.2.4.1.2.1.13.1.1.9. [MySqlDataReader.GetByte](#) Method**

Gets the value of the specified column as a byte.

Syntax: Visual Basic

```
NotOverridable Public Function GetByte( _  
    ByVal i As Integer _  
    ) As Byte _  
    Implements IDataRecord.GetByte
```

Syntax: C#

```
public byte GetByte(  
    inti  
);
```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetByte

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.10. [MySQLDataReader](#) . [GetBytes](#) Method

Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetBytes( _  
    ByVal i As Integer, _  
    ByVal dataIndex As Long, _  
    ByVal buffer As Byte(), _  
    ByVal bufferIndex As Integer, _  
    ByVal length As Integer _  
    ) As Long _  
    Implements IDataRecord.GetBytes
```

Syntax: C#

```
public long GetBytes(  
    inti,  
    longdataIndex,  
    byte[]buffer,  
    intbufferIndex,  
    intlength  
);
```

Parameters

- **i**: The zero-based column ordinal.
- **dataIndex**: The index within the field from which to begin the read operation.
- **buffer**: The buffer into which to read the stream of bytes.
- **bufferIndex**: The index for buffer to begin the read operation.
- **length**: The maximum length to copy into the buffer.

Return Value

The actual number of bytes read.

Implements

IDataRecord.GetBytes

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.11. [MySqlDataReader.GetChar](#) Method

Gets the value of the specified column as a single character.

Syntax: Visual Basic

```
NotOverridable Public Function GetChar( _  
    ByVal i As Integer _  
) As Char _  
    Implements IDataRecord.GetChar
```

Syntax: C#

```
public char GetChar(  
    inti  
);
```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetChar

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.12. [MySqlDataReader.GetChars](#) Method

Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetChars( _  
    ByVal i As Integer, _  
    ByVal fieldOffset As Long, _  
    ByVal buffer As Char(), _  
    ByVal bufferoffset As Integer, _  
    ByVal length As Integer _  
) As Long _  
    Implements IDataRecord.GetChars
```

Syntax: C#

```
public long GetChars(  
    inti,  
    longfieldOffset,  
    char[]buffer,  
    intbufferoffset,  
    intlength  
);
```

Parameters

- `i`:
- `fieldOffset`:
- `buffer`:
- `bufferoffset`:
- `length`:

Return Value**Implements**

IDataRecord.GetChars

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.13. [MySQLDataReader.GetDataTypeName](#) Method

Gets the name of the source data type.

Syntax: Visual Basic

```
NotOverridable Public Function GetDataTypeName( _  
    ByVal i As Integer _  
) As String _  
- Implements IDataRecord.GetDataTypeName
```

Syntax: C#

```
public string GetDataTypeName(  
    inti  
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetDataTypeName

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.14. [MySQLDataReader.GetDateTime](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetDateTime( _  
    ByVal index As Integer _  
) As Date _  
- Implements IDataRecord.GetDateTime
```

Syntax: C#

```
public DateTime GetDateTime(  
    int index  
);
```

Implements

IDataRecord.GetDateTime

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.15. [MySQLDataReader.GetDecimal](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetDecimal( _  
    ByVal index As Integer _  
) As Decimal _  
    Implements IDataRecord.GetDecimal
```

Syntax: C#

```
public decimal GetDecimal(  
    int index  
);
```

Implements

IDataRecord.GetDecimal

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.16. [MySQLDataReader.GetDouble](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetDouble( _  
    ByVal index As Integer _  
) As Double _  
    Implements IDataRecord.GetDouble
```

Syntax: C#

```
public double GetDouble(  
    int index  
);
```

Implements

IDataRecord.GetDouble

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.17. [MySQLDataReader.GetFieldType](#) Method

Gets the Type that is the data type of the object.

Syntax: Visual Basic

```
NotOverridable Public Function GetFieldType( _  
    ByVal i As Integer _  
) As Type _  
- Implements IDataRecord.GetFieldType
```

Syntax: C#

```
public Type GetFieldType(  
    inti  
);
```

Parameters

- **i:**

Return Value**Implements**

IDataRecord.GetFieldType

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.18. [MySQLDataReader.GetFloat](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetFloat( _  
    ByVal index As Integer _  
) As Single _  
- Implements IDataRecord.GetFloat
```

Syntax: C#

```
public float GetFloat(  
    intindex  
);
```

Implements

IDataRecord.GetFloat

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.19. [MySQLDataReader.GetGuid](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetGuid( _  
    ByVal index As Integer _  
) As Guid _  
- Implements IDataRecord.GetGuid
```

Syntax: C#

```
public Guid GetGuid(  
    intindex  
);
```

Implements

IDataRecord.GetGuid

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.20. [MySqlDataReader.GetInt16](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt16( _  
    ByVal index As Integer _  
) As Short _  
    Implements IDataRecord.GetInt16
```

Syntax: C#

```
public short GetInt16(  
    int index  
);
```

Implements

IDataRecord.GetInt16

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.21. [MySqlDataReader.GetInt32](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt32( _  
    ByVal index As Integer _  
) As Integer _  
    Implements IDataRecord.GetInt32
```

Syntax: C#

```
public int GetInt32(  
    int index  
);
```

Implements

IDataRecord.GetInt32

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.22. [MySqlDataReader.GetInt64](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt64( _  
    ByVal index As Integer _  
) As Long _  
    Implements IDataRecord.GetInt64
```

Syntax: C#

```
public long GetInt64(  

```

```
intindex  
);
```

Implements

IDataRecord.GetInt64

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.23. [MySQLDataReader.GetMySqlDateTime](#) Method

Syntax: Visual Basic

```
Public Function GetMySqlDateTime( _  
    ByVal index As Integer _  
) As MySqlDateTime
```

Syntax: C#

```
public MySqlDateTime GetMySqlDateTime(  
intindex  
);
```

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.24. [MySQLDataReader.GetName](#) Method

Gets the name of the specified column.

Syntax: Visual Basic

```
NotOverridable Public Function GetName( _  
    ByVal i As Integer _  
) As String _  
    Implements IDataRecord.GetName
```

Syntax: C#

```
public string GetName(  
inti  
);
```

Parameters

- [i](#):

Return Value**Implements**

IDataRecord.GetName

See Also

26.2.4.1.2.1.13.1.1.1.25. [MySQLDataReader.GetOrdinal](#) Method

Gets the column ordinal, given the name of the column.

Syntax: Visual Basic

```
NotOverridable Public Function GetOrdinal( _  
    ByVal name As String _  
    ) As Integer _  
    Implements IDataRecord.GetOrdinal
```

Syntax: C#

```
public int GetOrdinal(  
    stringname  
);
```

Parameters

- **name:**

Return Value**Implements**

IDataRecord.GetOrdinal

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.26. [MySQLDataReader.GetSchemaTable](#) Method

Returns a DataTable that describes the column metadata of the MySQLDataReader.

Syntax: Visual Basic

```
NotOverridable Public Function GetSchemaTable() As DataTable _  
    Implements IDataReader.GetSchemaTable
```

Syntax: C#

```
public DataTable GetSchemaTable();
```

Return Value**Implements**

IDataReader.GetSchemaTable

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.27. [MySQLDataReader.GetString](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetString( _  
    ByVal index As Integer _  
    ) As String _  
    Implements IDataRecord.GetString
```

Syntax: C#

```
public string GetString(  
    intindex
```

```
);
```

Implements

IDataRecord.GetString

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.28. [MySqlDataReader.GetString](#) Method

Syntax: Visual Basic

```
Public Function GetString( _  
    ByVal index As Integer _  
) As String
```

Syntax: C#

```
public String GetString(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.29. [MySqlDataReader.GetInt16](#) Method

Syntax: Visual Basic

```
Public Function GetInt16( _  
    ByVal index As Integer _  
) As Int16
```

Syntax: C#

```
public short GetInt16(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.30. [MySqlDataReader.GetInt32](#) Method

Syntax: Visual Basic

```
Public Function GetInt32( _  
    ByVal index As Integer _  
) As Int32
```

Syntax: C#

```
public int GetInt32(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.31. [MySqlDataReader.GetInt64](#) Method

Syntax: Visual Basic

```
Public Function GetUInt64( _  
    ByVal index As Integer _  
) As UInt64
```

Syntax: C#

```
public ulong GetUInt64(  
    int index  
);
```

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.32. [MySQLDataReader.GetValue](#) Method

Gets the value of the specified column in its native format.

Syntax: Visual Basic

```
NotOverridable Public Function GetValue( _  
    ByVal i As Integer _  
) As Object _  
    Implements IDataRecord.GetValue
```

Syntax: C#

```
public object GetValue(  
    int i  
);
```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetValue

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.33. [MySQLDataReader.GetValues](#) Method

Gets all attribute columns in the collection for the current row.

Syntax: Visual Basic

```
NotOverridable Public Function GetValues( _  
    ByVal values As Object() _  
) As Integer _  
    Implements IDataRecord.GetValues
```

Syntax: C#

```
public int GetValues(  
    object[] values  
);
```

Parameters

- `values:`

Return Value**Implements**

`IDataRecord.GetValues`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.34. [MySqlDataReader.IsDBNull](#) Method

Gets a value indicating whether the column contains non-existent or missing values.

Syntax: Visual Basic

```
NotOverridable Public Function IsDBNull( _  
    ByVal i As Integer _  
) As Boolean _  
    Implements IDataRecord.IsDBNull
```

Syntax: C#

```
public bool IsDBNull(  
    int i  
);
```

Parameters

- `i:`

Return Value**Implements**

`IDataRecord.IsDBNull`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.1.35. [MySqlDataReader.NextResult](#) Method

Advances the data reader to the next result, when reading the results of batch SQL statements.

Syntax: Visual Basic

```
NotOverridable Public Function NextResult() As Boolean _  
    Implements IDataReader.NextResult
```

Syntax: C#

```
public bool NextResult();
```

Return Value**Implements**

IDataReader.NextResult

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.1.1.36. [MySQLDataReader.Read](#) Method

Advances the MySQLDataReader to the next record.

Syntax: Visual Basic

```
NotOverridable Public Function Read() As Boolean _  
    Implements IDataReader.Read
```

Syntax: C#

```
public bool Read();
```

Return Value

Implements

IDataReader.Read

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.13.2. [MySQLCommand.ExecuteReader](#) Method

Syntax: Visual Basic

```
Overloads Public Function ExecuteReader( _  
    ByVal behavior As CommandBehavior _  
) As MySQLDataReader
```

Syntax: C#

```
public MySQLDataReader ExecuteReader(  
    CommandBehavior behavior  
);
```

26.2.4.1.2.1.14. [MySQLCommand.ExecuteScalar](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function ExecuteScalar() As Object _  
    Implements IDbCommand.ExecuteScalar
```

Syntax: C#

```
public object ExecuteScalar();
```

Implements

IDbCommand.ExecuteScalar

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.2.1.15. MySqlCommand.Prepare Method

Syntax: Visual Basic

```
NotOverridable Public Sub Prepare() _  
    Implements IDbCommand.Prepare
```

Syntax: C#

```
public void Prepare();
```

Implements

IDbCommand.Prepare

See Also

[MySqlCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.3. MySqlCommandBuilder Class

For a list of all members of this type, see [MySqlCommandBuilder Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlCommandBuilder_  
    Inherits Component
```

Syntax: C#

```
public sealed class MySqlCommandBuilder : Component
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlCommandBuilder Members](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.3.1. MySqlCommandBuilder Members

[MySqlCommandBuilder overview](#)

Public Static (Shared) Methods

 DeriveParameters 	Overloaded. Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySql.

Public Instance Constructors

MySQLCommandBuilder	Overloaded. Initializes a new instance of the MySqlCommand-Builder class.

Public Instance Properties

Container(inherited from Component)	Gets the IContainerthat contains the Component.
DataAdapter	
QuotePrefix	
QuoteSuffix	
Site(inherited from Component)	Gets or sets the ISiteof the Component.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information re-quired to generate a proxy used to communicate with a remote ob-ject.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Ob-ject.
GetDeleteCommand	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetInsertCommand	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the life-time policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
GetUpdateCommand	
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
RefreshSchema	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposedevent on the com-ponent.

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.1. DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Overload List

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

- [public static void DeriveParameters\(MySqlCommand\);](#)
- [public static void DeriveParameters\(MySqlCommand,bool\);](#)

See Also

[MySqlCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.1.1. MySqlCommandBuilder.DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Syntax: Visual Basic

```
Overloads Public Shared Sub DeriveParameters( _  
    ByVal command As MySqlCommand _  
)
```

Syntax: C#

```
public static void DeriveParameters(  
    MySqlCommandcommand  
);
```

Parameters

- **command**: The MySqlCommand referencing the stored procedure from which the parameter information is to be derived. The derived parameters are added to the Parameters collection of the MySqlCommand.

Exceptions

Exception Type	Condition
InvalidOperationException	The command text is not a valid stored procedure name.

26.2.4.1.3.1.2.2.1.1. [MySqlDataAdapter](#) Members

[MySqlDataAdapter overview](#)

Public Instance Constructors

MySqlDataAdapter	Overloaded. Initializes a new instance of the MySqlDataAdapter class.

Public Instance Properties

AcceptChangesDuringFill (inherited from DataAdapter)	Gets or sets a value indicating whether AcceptChanges is called on a DataRow after it is added to the DataTable during any of the Fill operations.
AcceptChangesDuringUpdate (inherited from DataAdapter)	Gets or sets whether AcceptChanges is called during a Update .
Container (inherited from Component)	Gets the IContainer that contains the Component .
ContinueUpdateOnError (inherited from DataAdapter)	Gets or sets a value that specifies whether to generate an exception when an error is encountered during a row update.
DeleteCommand	Overloaded.
FillLoadOption (inherited from DataAdapter)	Gets or sets the LoadOption that determines how the adapter fills the DataTable from the DbDataReader .
InsertCommand	Overloaded.
MissingMappingAction (inherited from DataAdapter)	Determines the action to take when incoming data does not have a matching table or column.
MissingSchemaAction (inherited from DataAdapter)	Determines the action to take when existing DataSet schema does not match incoming data.
ReturnProviderSpecificTypes (inherited from DataAdapter)	Gets or sets whether the Fill method should return provider-specific values or common CLS-compliant values.
SelectCommand	Overloaded.
Site (inherited from Component)	Gets or sets the ISite of the Component .
TableMappings (inherited from DataAdapter)	Gets a collection that provides the master mapping between a source table and a DataTable .
UpdateBatchSize (inherited from DbDataAdapter)	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.
UpdateCommand	Overloaded.

Public Instance Methods

CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote ob-

	ject.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
Fill(inherited from DbDataAdapter)	Overloaded. Adds or refreshes rows in the DataSet to match those in the data source using the DataSetname, and creates a DataTable named "Table."
FillSchema(inherited from DbDataAdapter)	Overloaded. Configures the schema of the specified DataTable based on the specified SchemaType.
GetFillParameters(inherited from DbDataAdapter)	Gets the parameters set by the user when executing an SQL SELECT statement.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ResetFillLoadOption(inherited from DataAdapter)	Resets FillLoadOption to its default state and causes Fill to honor AcceptChangesDuringFill.
ShouldSerializeAcceptChangesDuringFill(inherited from DataAdapter)	Determines whether the AcceptChangesDuringFill property should be persisted.
ShouldSerializeFillLoadOption(inherited from DataAdapter)	Determines whether the FillLoadOption property should be persisted.
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.
Update(inherited from DbDataAdapter)	Overloaded. Calls the respective INSERT, UPDATE, or DELETE statements for each inserted, updated, or deleted row in the specified DataSet.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
FillError(inherited from DataAdapter)	Returned when an error occurs during a fill operation.
RowUpdated	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
RowUpdating	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Protected Internal Instance Properties

FillCommandBehavior(inherited from DbDataAdapter)	Gets or sets the behavior of the command used to fill the data adapter.

26.2.4.1.3.1.2.2.1.1.6. [MySqlDataAdapter](#) .RowUpdated Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdated As MySqlRowUpdatedEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatedEventHandler RowUpdated;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatedEventArgs](#) containing data related to this event. The following [MySqlRowUpdatedEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand executed when Update is called.
Errors	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row	Gets the DataRow sent through an Update.
RowCount	Gets the number of rows processed in a batch of updated records.
StatementType	Gets the type of SQL statement executed.
Status	Gets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping sent through an Update.

[MySqlRowUpdatedEventArgs overview](#)

Public Instance Constructors

MySqlRowUpdatedEventArgs Constructor	Initializes a new instance of the MySqlRowUpdatedEventArgs class.

Public Instance Properties

Command	Overloaded. Gets or sets the MySqlCommand executed when Update is called.
Errors(inherited from RowUpdatedEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected(inherited from RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Row(inherited from RowUpdatedEventArgs)	Gets the DataRow sent through an Update.
RowCount(inherited from RowUpdatedEventArgs)	Gets the number of rows processed in a batch of updated records.
StatementType(inherited from RowUpdatedEventArgs)	Gets the type of SQL statement executed.
Status(inherited from RowUpdatedEventArgs)	Gets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatedEventArgs)	Gets the DataTableMapping sent through an Update.

Public Instance Methods

CopyToRows(inherited from RowUpdatedEventArgs)	Overloaded. Copies references to the modified rows into the provided array.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLRowUpdatedEventArgs Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.2.2.1.1.6.1.1.1.1. MySQLRowUpdatedEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatedEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatedEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- **row**: The DataRow sent through an Update.
- **command**: The IDbCommand executed when Update is called.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an Update.

26.2.4.1.3.1.2.2.1.1.6.1.1.1.2. Command Property

Gets or sets the MySqlCommand executed when Update is called.

Syntax: Visual Basic

```
Overloads Public ReadOnly Property Command As MySqlCommand
```

Syntax: C#

```
new public MySqlCommand Command {get;}
```

See Also

[MySqlRowUpdatedEventArgs Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.2.2.1.1.7. [MySqlDataAdapter.RowUpdating](#) Event

Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdating As MySqlRowUpdatingEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatingEventHandler RowUpdating;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatingEventArgs](#) containing data related to this event. The following [MySqlRowUpdatingEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand to execute when performing the Update.
Errors	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType	Gets the type of SQL statement to execute.
Status	Gets or sets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping to send through the Update.

26.2.4.1.3.1.2.2.1.1.7.1. [MySqlRowUpdatingEventHandler](#) Delegate

Represents the method that will handle the RowUpdating event of a [MySqlDataAdapter](#).

Syntax: Visual Basic

```
Public Delegate Sub MySqlRowUpdatingEventHandler( _  
    ByVal sender As Object, _  
    ByVal e As MySqlRowUpdatingEventArgs _  
)
```

Syntax: C#

```
public delegate void MySqlRowUpdatingEventHandler(  
    object sender,
```

```
MySQLRowUpdatingEventArgs
};
```

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.2.2.1.1.7.1.1.1. MySQLRowUpdatingEventArgs Class

Provides data for the RowUpdating event. This class cannot be inherited.

For a list of all members of this type, see [MySQLRowUpdatingEventArgs Members](#).

Syntax: Visual Basic

```
NotInheritable Public Class MySQLRowUpdatingEventArgs_
    Inherits RowUpdatingEventArgs
```

Syntax: C#

```
public sealed class MySQLRowUpdatingEventArgs : RowUpdatingEventArgs
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

26.2.4.1.3.1.2.2.1.1.7.1.1.1.1. MySQLRowUpdatingEventArgs Members

[MySQLRowUpdatingEventArgs overview](#)

Public Instance Constructors

MySQLRowUpdatingEventArgs Constructor	Initializes a new instance of the MySQLRowUpdatingEventArgs class.

Public Instance Properties

Command	Overloaded. Gets or sets the MySqlCommand to execute when performing the Update.
Errors(inherited from RowUpdatingEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row(inherited from RowUpdatingEventArgs)	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType(inherited from RowUpdatingEventArgs)	Gets the type of SQL statement to execute.
Status(inherited from RowUpdatingEventArgs)	Gets or sets the UpdateStatus of the Command property.

TableMapping(inherited from RowUpdatingEventArgs)	Gets the DataTableMapping to send through the Update.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

26.2.4.1.3.1.2.2.1.1.7.1.1.1.1. MySQLRowUpdatingEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatingEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatingEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- **row**: The DataRow to update.
- **command**: The IDbCommand to execute during update.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an update.

26.2.4.1.3.1.2.2.1.1.7.1.1.1.2. Command Property

Gets or sets the MySqlCommand to execute when performing the update.

Syntax: Visual Basic

```
Overloads Public Property Command As MySqlCommand
```

Syntax: C#

```
new public MySqlCommand Command {get; set;}
```

See Also

[MySQLRowUpdatingEventArgs Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.3.1.2.3. [MySQLCommandBuilder](#) Constructor

Syntax: Visual Basic

```
Overloads Public Sub New( _  
    ByVal adapter As MySqlDataAdapter, _  
    ByVal lastOneWins As Boolean _  
)
```

Syntax: C#

```
public MySqlCommandBuilder(  
    MySqlDataAdapteradapter,  
    boollastOneWins  
);
```

26.2.4.1.3.1.9. MySqlCommandBuilder.RefreshSchema Method

Syntax: Visual Basic

```
Public Sub RefreshSchema()
```

Syntax: C#

```
public void RefreshSchema();
```

See Also

[MySqlCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.4. MySqlConnectionException Class

The exception that is thrown when MySQL returns an error. This class cannot be inherited.

For a list of all members of this type, see [MySqlConnectionException Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlConnectionException_  
    Inherits SystemException
```

Syntax: C#

```
public sealed class MySqlConnectionException : SystemException
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlConnection](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySqlConnectionException Members](#) , [MySQL.Data.MySqlConnection Namespace](#)

26.2.4.1.4.1. MySqlConnectionException Members

[MySqlConnectionException overview](#)

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Number	Gets a number that identifies the type of error.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

[MySqlException Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.4.1.1. Number Property

Gets a number that identifies the type of error.

Syntax: Visual Basic

```
Public ReadOnly Property Number As Integer
```

Syntax: C#

```
public int Number {get;}
```

See Also

[MySqlException Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5. MySqlHelper Class

Helper class that makes it easier to work with the provider.

For a list of all members of this type, see [MySqlHelper Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlHelper
```

Syntax: C#

```
public sealed class MySqlHelper
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySQLHelper Members](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.5.1. MySQLHelper Members

[MySQLHelper overview](#)

Public Static (Shared) Methods

ExecuteDataRow	Executes a single SQL command and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteDataset	Overloaded. Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteNonQuery	Overloaded. Executes a single command against a MySQL database. The MySqlConnection is assumed to be open when the method is called and remains open after the method completes.
ExecuteReader	Overloaded. Executes a single command against a MySQL database.
ExecuteScalar	Overloaded. Execute a single command against a MySQL database.
UpdateDataSet	Updates the given table with data from the given DataSet

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType (inherited from Object)	Gets the Type of the current instance.
ToString (inherited from Object)	Returns a String that represents the current Object.

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.1. MySQLHelper.ExecuteDataRow Method

Executes a single SQL command and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Public Shared Function ExecuteDataRow( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As DataRow
```

Syntax: C#

```
public static DataRow ExecuteDataRow(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- **connectionString**: Settings to be used for the connection
- **commandText**: Command to execute
- **parms**: Parameters to use for the command

Return Value

DataRow containing the first row of the resultset

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.2. ExecuteDataset Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Overload List

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection,string);`

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection,string,params MySqlParameter[]);`

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string);`

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string,params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.2.1. `MySqlHelper.ExecuteDataset` Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    MySqlConnection connection,  
    string commandText  
);
```

Parameters

- **connection**: [MySqlConnection](#) object to use
- **commandText**: Command to execute

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

26.2.4.1.5.1.2.2. [MySQLHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    MySqlConnection connection,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

Parameters

- **connection**: [MySqlConnection](#) object to use
- **commandText**: Command to execute
- **commandParameters**: Parameters to use for the command

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

26.2.4.1.5.1.2.3. [MySQLHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _
```

```
ByVal commandText As String _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    string connectionString,  
    string commandText  
);
```

Parameters

- **connectionString**: Settings to be used for the connection
- **commandText**: Command to execute

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

26.2.4.1.5.1.2.4. [MySQLHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    string connectionString,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

Parameters

- **connectionString**: Settings to be used for the connection
- **commandText**: Command to execute
- **commandParameters**: Parameters to use for the command

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

26.2.4.1.5.1.3. [ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and re-

mains open after the method completes.

Overload List

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

- [public static int ExecuteNonQuery\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

- [public static int ExecuteNonQuery\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.3.1. [MySqlHelper.ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
    ) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(  
    MySqlConnectionconnection,  
    stringcommandText,  
    params MySqlParameter[]commandParameters  
);
```

Parameters

- [connection](#): [MySqlConnection](#) object to use
- [commandText](#): SQL command to be executed
- [commandParameters](#): Array of [MySqlParameter](#) objects to use with the command.

Return Value

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteNonQuery Overload List](#)

26.2.4.1.5.1.3.2. [MySqlHelper.ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray parms As MySqlParameter() _  
    ) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    string connectionString,
    string commandText,
    params MySqlParameter[] params
);
```

Parameters

- **connectionString**: [ConnectionString](#) to use
- **commandText**: SQL command to be executed
- **params**: Array of [MySqlParameter](#) objects to use with the command.

Return Value**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteNonQuery Overload List](#)

26.2.4.1.5.1.4. ExecuteReader Method

Executes a single command against a MySQL database.

Overload List

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string\);](#)

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.4.1. [MySqlHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText
);
```

Parameters

- **connectionString**: Settings to use for this command

- [commandText](#): Command text to use

Return Value

[MySQLDataReader](#) object ready to read the results of the command

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteReader Overload List](#)

26.2.4.1.5.1.4.2. [MySQLHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(  
    string connectionString,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

Parameters

- [connectionString](#): Settings to use for this command
- [commandText](#): Command text to use
- [commandParameters](#): Array of [MySqlParameter](#) objects to use with the command

Return Value

[MySQLDataReader](#) object ready to read the results of the command

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteReader Overload List](#)

26.2.4.1.5.1.5. ExecuteScalar Method

Execute a single command against a MySQL database.

Overload List

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(string,string);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(string,string,params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

26.2.4.1.5.1.5.1. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnectionconnection,  
    stringcommandText  
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command text to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

26.2.4.1.5.1.5.2. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnectionconnection,  
    stringcommandText,  
    params MySqlParameter[]commandParameters  
);
```

Parameters

- **connection**: [MySQLConnection](#) object to use
- **commandText**: Command text to use for the command
- **commandParameters**: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

26.2.4.1.5.1.5.3. [MySQLHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connectionString As String, _  
    ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
string connectionString,  
string commandText  
);
```

Parameters

- **connectionString**: Settings to use for the update
- **commandText**: Command text to use for the update

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteScalar Overload List](#)

26.2.4.1.5.1.5.4. [MySQLHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
string connectionString,  
string commandText,  
params MySqlParameter[] commandParameters  
);
```

Parameters

- **connectionString**: Settings to use for the command
- **commandText**: Command text to use for the command
- **commandParameters**: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

26.2.4.1.5.1.6. MySQLHelper.UpdateDataSet Method

Updates the given table with data from the given DataSet

Syntax: Visual Basic

```
Public Shared Sub UpdateDataSet( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ByVal ds As DataSet, _  
    ByVal tablename As String _  
)
```

Syntax: C#

```
public static void UpdateDataSet(  
stringconnectionString,  
stringcommandText,  
DataSetds,  
stringtablename  
);
```

Parameters

- **connectionString**: Settings to use for the update
- **commandText**: Command text to use for the update
- **ds**: DataSetcontaining the new data to use in the update
- **tablename**: Tablename in the dataset to update

Public Instance Constructors

MySQLConversionException Constructor	Ctor

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exceptioninstance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exceptionthat is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfowith information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception.

Protected Instance Methods

Finalize(inherited from Object)	Allows an Objectto attempt to free resources and perform other

	cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Public Static (Shared) Type Conversions

Explicit MySQLDateTime to DateTime Conversion	

Public Instance Properties

Day	Returns the day portion of this datetime
Hour	Returns the hour portion of this datetime
IsNull (inherited from MySQLValue)	
IsValidDateTime	Indicates if this object contains a value that can be represented as a DateTime
Minute	Returns the minute portion of this datetime
Month	Returns the month portion of this datetime
Second	Returns the second portion of this datetime
ValueAsObject (inherited from MySQLValue)	Returns the value of this field as an object
Year	Returns the year portion of this datetime

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object .
GetDateTime	Returns this value as a DateTime
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType (inherited from Object)	Gets the Type of the current instance.
ToString	Returns a MySQL specific string representation of this value

Protected Instance Fields

classType (inherited from MySQLValue)	The system type represented by this value
dbType (inherited from MySQLValue)	The generic dbtype of this value
isNull (inherited from MySQLValue)	Is this value null
mysqlDbType (inherited from MySQLValue)	The specific MySQL db type
mysqlTypeName (inherited from MySQLValue)	The MySQL specific typename of this value
objectValue (inherited from MySQLValue)	

Protected Instance Methods

Finalize (inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone (inherited from Object)	Creates a shallow copy of the current Object .

26.2.5. Connector/NET Notes and Tips

In this section we will cover some of the more common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

26.2.5.1. Connecting to MySQL Using Connector/NET

26.2.5.1.1. Introduction

All interaction between a .NET application and the MySQL server is routed through a [MySqlConnection](#) object. Before your application can interact with the server, a [MySqlConnection](#) object must be instantiated, configured, and opened.

Even when using the [MySqlHelper](#) class, a [MySqlConnection](#) object is created by the helper class.

In this section, we will describe how to connect to MySQL using the [MySqlConnection](#) object.

26.2.5.1.2. Creating a Connection String

The [MySqlConnection](#) object is configured using a connection string. A connection string contains sever key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the [MySqlConnection](#) object is configured to connect to a MySQL server at [127.0.0.1](#), with a username of [root](#) and a password of [12345](#). The default database for all statements will be the [test](#) database.

The following options are typically used (a full list of options is available in the API documentation for [Section 26.2.3.3.15](#), “[ConnectionString](#)”):

- **Server**: The name or network address of the instance of MySQL to which to connect. The default is [localhost](#). Aliases include [host](#), [Data Source](#), [DataSource](#), [Address](#), [Addr](#) and [Network Address](#).
- **Uid**: The MySQL user account to use when connecting. Aliases include [User Id](#), [Username](#) and [User name](#).
- **Pwd**: The password for the MySQL account being used. Alias [Password](#) can also be used.
- **Database**: The default database that all statements are applied to. Default is [mysql](#). Alias [Initial Catalog](#) can also be used.
- **Port**: The port MySQL is using to listen for connections. Default is [3306](#). Specify [-1](#) for this value to use a named-pipe connection.

26.2.5.1.3. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a [MySQLConnection](#) object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()

Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the [MySQLConnection](#) class:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

26.2.5.1.4. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the `MySQLConnection` class will return a `MySqlException` object. This object has two properties that are of interest when handling errors:

- **Message**: A message that describes the current exception.
- **Number**: The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0**: Cannot connect to server.
- **1045**: Invalid username and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```
Dim myConnectionString as String
myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}
```

Important

Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do

not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```
MySQLConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
"pwd=12345;database=test;Charset=latin1;");
```

26.2.5.2. Using the Connector/NET with Prepared Statements

26.2.5.2.1. Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

26.2.5.2.2. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)"
    cmd.Prepare()

    cmd.Parameters.Add("?number", 1)
    cmd.Parameters.Add("?text", "One")

    For i = 1 To 1000
        cmd.Parameters["?number"].Value = i
        cmd.Parameters["?text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.E
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
{
    conn.Open();
```

```

cmd.Connection = conn;
cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)";
cmd.Prepare();

cmd.Parameters.Add("?number", 1);
cmd.Parameters.Add("?text", "One");

for (int i=1; i <= 1000; i++)
{
    cmd.Parameters["?number"].Value = i;
    cmd.Parameters["?text"].Value = "A string value";

    cmd.ExecuteNonQuery();
}
}
catch (MySQL.Data.MySqlClient.MySQLException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

26.2.5.3. Accessing Stored Procedures with Connector/NET

26.2.5.3.1. Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySQLCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySQLCommand.Parameters` collection.

Note

When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

26.2.5.3.2. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the `mysql` command-line client. Second, stored procedures can be created using the `MySQL Query Browser` GUI client. Finally, stored procedures can be created using the `.ExecuteNonQuery` method of the `MySQLCommand` object:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

```

```

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.E
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

26.2.5.3.3. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a [MySqlCommand](#) object and pass the stored procedure name as the [.CommandText](#) property. Set the [.CommandType](#) property to [CommandType.StoredProcedure](#).

After the stored procedure is named, create one [MySqlCommand](#) parameter for every parameter in the stored procedure. [IN](#) parameters are defined with the parameter name and the object containing the value, [OUT](#) parameters are defined with the parameter name and the datatype that is expected to be returned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the [MySqlCommand.ExecuteNonQuery\(\)](#) method:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("?lname", 'Jones')
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?fname", 'Tom')
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input

```

```

cmd.Parameters.Add("?bday", #12/13/1977 2:17:36 PM#)
cmd.Parameters["?bday"].Direction = ParameterDirection.Input

cmd.Parameters.Add("?empno", MySqlDbType.Int32)
cmd.Parameters["?empno"].Direction = ParameterDirection.Output

cmd.ExecuteNonQuery()

MessageBox.Show(cmd.Parameters["?empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "add_emp";
    cmd.CommandType = CommandType.StoredProcedure;

    cmd.Parameters.Add("?lname", "Jones");
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?fname", "Tom");
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?empno", MySqlDbType.Int32);
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output;

    cmd.ExecuteNonQuery();

    MessageBox.Show(cmd.Parameters["?empno"].Value);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySQLConnector.Parameters` collection.

26.2.5.4. Handling BLOB Data With Connector/NET

26.2.5.4.1. Introduction

One common use for MySQL is the storage of binary data in **BLOB** columns. MySQL supports four different BLOB datatypes: **TINYBLOB**, **BLOB**, **MEDIUMBLOB**, and **LONGBLOB**.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the [Samples](#) directory of the Connector/NET installation.

26.2.5.4.2. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an **AUTO_INCREMENT** column of appropriate size (**UNSIGNED SMALLINT**) to serve as a primary key to identify the file, a **VARCHAR** column that stores the filename, an **UNSIGNED MEDIUMINT** column that stores the size of the file, and a **MEDIUMBLOB** column that stores the file itself. For this example, I will use the following table definition:

```
CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);
```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the **APPLY CHANGES** button and restart the server using the [Service Control](#) screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM;` syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

26.2.5.4.3. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an [INSERT](#) query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into the `file` table:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("?FileName", strFileName)
    cmd.Parameters.Add("?FileSize", FileSize)
    cmd.Parameters.Add("?File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
```

```

cmd = new MySql.Data.MySqlClient.MySqlCommand();
string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)";

    cmd.Connection = conn;
    cmd.CommandText = SQL;
    cmd.Parameters.Add("?FileName", strFileName);
    cmd.Parameters.Add("?FileSize", FileSize);
    cmd.Parameters.Add("?File", rawData);

    cmd.ExecuteNonQuery();

    MessageBox.Show("File Inserted into database successfully!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The [Read](#) method of the [FileStream](#) object is used to load the file into a byte array which is sized according to the [Length](#) property of the [FileStream](#) object.

After assigning the byte array as a parameter of the [MySqlCommand](#) object, the [ExecuteNonQuery](#) method is called and the BLOB is inserted into the [file](#) table.

26.2.5.4.4. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the [file](#) table, we can use the [MySqlDataReader](#) class to retrieve it.

The following code retrieves a row from the [file](#) table, then loads the data into a [FileStream](#) object to be written to disk:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySqlDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" & _
    & "uid=root;" & _
    & "pwd=12345;" & _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

```

```

        FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
        rawData = New Byte(FileSize) {}

        myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

        fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
        fs.Write(rawData, 0, FileSize)
        fs.Close()

        MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

        myData.Close()
        conn.Close()
    Catch ex As Exception
        MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
    End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataReader myData;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");

    myData.Read();

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
    rawData = new byte[FileSize];

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

    fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
    fs.Write(rawData, 0, FileSize);
    fs.Close();

    MessageBox.Show("File successfully written to disk!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    myData.Close();
    conn.Close();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the **file** table are loaded into a **MySqlDataReader** object. The **GetBytes** method of the **MySqlDataReader** is used to load the BLOB into a byte array, which is then written to disk using a **FileStream** object.

The **GetOrdinal** method of the **MySqlDataReader** can be used to determine the integer index of a named column. Use of the **GetOrdinal** method prevents errors if the column order of the **SELECT** query is changed.

26.2.5.5. Using Connector/NET with Crystal Reports

26.2.5.5.1. Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

26.2.5.5.2. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a dataset that matches the one expected by your report.

The second option is to create a dataset in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the dataset. If you forget a column you must re-create the dataset before the column can be added to the report.

The following code can be used to create a dataset from a query and write it to disk:

Visual Basic Example

```
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
DataSet myData = new DataSet();
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();
myAdapter = new MySQL.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from dev.mysql.com.

26.2.5.5.3. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved dataset, choose the ADO.NET (XML) option and browse to your saved dataset.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

26.2.5.5.4. Displaying the Report

To display a report we first populate a dataset with the data needed for the report, then load the report and bind it to the dataset. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a dataset saved using the code shown in [Section 26.2.5.5.2, “Creating a Data Source”](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```
Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _
    "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@"..\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new dataset is generated using the same query used to generate the previously saved dataset. Once the dataset is filled, a ReportDocument is used to load the report file and bind it to the dataset. The ReportDocument is then passed as the ReportSource of the crViewer.

This same approach is taken when a report is created from a single table using Connector/ODBC. The dataset replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a dataset with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a report in the dataset.

We populate a dataset with multiple tables by providing multiple **SELECT** statements in our MySqlCommand object. These **SELECT** statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```

SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Population`
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code` = `city`.`CountryCode`
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`

```

This query is converted to two **SELECT** queries and displayed with the following code:

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name;" _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

```

```

myAdapter.SelectCommand = cmd
myAdapter.Fill(myData)

myReport.Load(".\world_report.rpt")
myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It is important to order the **SELECT** queries in alphabetical order, as this is the order the report will expect its source tables to be in. One **SetDataSource** statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved dataset.

26.2.5.6. Handling Date and Time Information in Connector/NET

26.2.5.6.1. Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/NET.

26.2.5.6.2. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET **DateTime** objects, including **NULL** dates.

Because of this issue, .NET **DataSet** objects cannot be populated by the **Fill** method of the **MySqlDataAdapter** class as invalid dates will cause a **System.ArgumentOutOfRangeException** exception to occur.

26.2.5.6.3. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.2.6, “SQL Modes”](#).

26.2.5.6.4. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return `MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, `2005-02-23 08:50:25`). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports NULL dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySqlDateTime` to a `DateTime` if you do not check for NULL first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

26.2.5.6.5. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a dataset and can be bound to form controls without special handling.

26.2.6. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.8](#), “How to Report Bugs or Problems”.

26.2.6.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from MySQL AB. Additional information is available at <http://www.mysql.com/support/>.

26.2.6.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 26.2.6.1](#), “Connector/NET Community Support”.

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

26.2.6.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.3](#), “Connector/NET Change History”.

26.3. MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin is a DDEX provider; a plug-in for Visual Studio 2005 that allows developers to maintain database structures, and supports built-in data-driven application development tools.

The current version of the MySQL Visual Studio Plugin includes only database maintenance tools. Data-driven application development tools are not supported.

The MySQL DDEX Provider operates as a standard extension to the Visual Studio Data Designer functionality available through the Server Explorer menu of Visual Studio 2005, and enables developers to create database objects and data within a MySQL database.

The MySQL Visual Studio Plugin is designed to work with MySQL version 5.0, but is also compatible with MySQL 4.1.1 and provides limited compatibility with MySQL 5.1.

26.3.1. Installing the MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin requires one of Visual Studio 2005 Standard, Professional or Team Developer Edition to be installed.

Other editions of Visual Studio 2005 are not supported.

Note

Starting with Connector/NET 5.1.2, the Visual Studio Plugin is included in the installation. If you have installed Connector/NET 5.1.2, then you do not need to separately install the Visual Studio Plugin.

Here is the list of components that should already be installed before starting the installation of the MySQL Visual Studio Plugin:

- Visual Studio 2005 Standard, Professional or Team Developer Edition.
- MySQL Server 4.1.1 or later (either installed on the same machine, or a separate server).
- MySQL Connector/NET 5.0.

Note

When installing Connector/NET you must ensure that the connector is installed into the Global Assembly Cache (GAC). The Connector/NET installer handles this for you automatically, but in a custom installation the option may have been disabled.

The user used to connect to the MySQL server must have the following privileges to use the functionality provided by the MySQL Visual Studio Plugin:

- The **SELECT** privilege for the **INFORMATION_SCHEMA** database.
- The **EXECUTE** privilege for the **SHOW CREATE TABLE** statement.
- The **SELECT** privilege for the **mysql.proc** table (required for operations with stored procedures and functions).
- The **SELECT** privilege for the **mysql.func** table (required for operations with User Defined Functions (UDF)).
- The **EXECUTE** privilege for the **SHOW ENGINE STATUS** statement (required for retrieving extended error information).
- Appropriate privileges for performed operations (e.g. the **SELECT** privilege is required to browse data from a table etc.).

The MySQL Visual Studio Plugin is delivered as a MSI package that can be used to install, uninstall or reinstall the Provider. If you are not using Windows XP or Windows Server 2003 you upgrade the Windows Installer system to the latest version (see <http://support.microsoft.com/default.aspx?scid=kb;EN-US;292539> for details).

The MSI-package is named **MySQL.VisualStudio.msi**. To install the MySQL Visual Studio Plugin, right click on the MSI file and select **INSTALL**. The installation process is as follow:

1. The standard Welcome dialog is opened. Click Next to continue installation.
2. The License agreement (GNU GPL) window is opened. Accept the agreement and click NEXT to continue.
3. The destination folder choice dialog is opened. Here you can point out the folder where the MySQL Visual Studio Plugin will be installed. The default destination folder is **%ProgramFilesDir%\MySQL\MySQL DDEX Data Provider**, where **%ProgramFilesDir%** is the Program Files folder of the installation machine. After choosing the destination folder, click NEXT to continue.
4. The installer will ask to confirm that installation. Click Install to start installation process.
5. The installation will now take place. At the end of this step the Visual Studio command table is rebuilt (this process may take several minutes).
6. Once installation is complete, click FINISH to end the installation process.

To uninstall the MySQL Visual Studio Plugin, you can use either Add/Remove Programs component of the Control Panel or the same

MSI-package. Choose the **REMOVE** option, and the Provider will be uninstalled automatically.

To repair the Provider, right click the MSI-package and choose the **REPAIR** option. The MySQL Visual Studio Plugin will be repaired automatically.

The installation package includes the following files:

- **MySQL.VisualStudio.dll** — the MySQL DDEX Provider assembly.
- **MySQL.Data.dll** — the assembly containing the MySQL Connector .NET which is used by the Provider.
- **MySQL.VisualStudio.dll.config** — the configuration file for the MySQL Visual Studio Plugin. This file contains default values for the provider GUI layout.

Note

Do not remove this file before the first use of the Provider.

- **Register.reg** — the file with registry entries that can be used to register the MySQL DDEX Provider in the case of the manual installation.
- **Install.js** — the script used to register the Connector .NET as an ADO.NET data provider in the machine.config file.
- **Release notes.doc** — the document with release notes.

To install the Provider manually, copy all files of the installation package in a desired folder, then set the full path to the Provider assembly as a value of the CodeBase entry. For example:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\VisualStudio\8.0\Packages\{79A115C9-B133-4891-9E7B-242509DAD272}]@="MySQL.Data.VisualStudio"
"InprocServer32"="C:\\WINNT\\system32\\mscorlib.dll"
"Class"="MySQL.Data.VisualStudio.MySqlDataProviderPackage"
"CodeBase"="C:\\MySQLDdexProvider\\MySQL.VisualStudio.dll"
```

Then import information from the Register.reg file to the registry by clicking of the file. At the confirmation dialog choose Yes. Next you must run the command `devenv.exe /setup` within a Command Prompt to rebuild the Visual Studio command table.

26.3.2. Creating a connection to the MySQL server

Once the MySQL Visual Studio Plugin is installed, you can use it to create, modify and delete connections to MySQL databases. To create a connection with a MySQL database, perform the following steps:

1. Start Visual Studio 2005 and open Server Explorer window by choosing the **SERVER EXPLORER** option from the **VIEW** menu.
2. Right click on the **DATA CONNECTIONS** node and choose the **ADD CONNECTION** button.
3. The Add Connection dialog is opened. Press the **CHANGE** button to choose MySQL Database as a data source.
4. Change Data Source dialog is opened. Choose MySQL Database in the list of data sources (or the **other** option, if MySQL Database is absent), and then choose **.NET FRAMEWORK DATA PROVIDER FOR MYSQL** in the combo box of data providers.

Press OK to confirm your choice.

5. Enter the connection settings: the server host name (for example, localhost if the MySQL server is installed on the local machine), the user name, the password, and the default database schema. Note that you must specify the default schema name to open the connection.

6. You can also set the port to connect with the MySQL server by pressing the ADVANCED button. To test a connection with the MySQL server, set the server host name, the user name, and the password, and press the TEST CONNECTION button. If the test fails, check the connection values that you have supplied are correct and that the corresponding user and privileges have been configured on the MySQL server.

- After you set all settings and test the connection, press OK. The newly created connection is displayed in Server Explorer. Now you can work with the MySQL server through standard Server Explorer interface.

After a connection is successfully established, all the connection settings are saved. When you next open Visual Studio, the connection to the MySQL server will appear within Server Explorer so that you can re-establish a connection to the MySQL server.

To modify and delete a connection, use the **SERVER EXPLORER** context menu for the corresponding node. You can modify any of the settings just by overwriting the existing values with new ones. Note that a connection should be modified or deleted only if no active editor for its objects is opened. Otherwise your data could be lost.

26.3.3. Using the MySQL Visual Studio Plugin

To work with a MySQL server using the MySQL Visual Studio Plugin, open the Visual Studio 2005, open the **SERVER EXPLORER**, and select the required connection. The working area of the MySQL Visual Studio Plugin consists of three parts.

- Database objects (tables, views, stored routines, triggers, and user defined functions) are displayed in the Server Explorer tree. Here you can choose an object and edit its properties and definition.
- Properties of a selected database object are displayed in the **PROPERTIES** panel. Certain properties can be edited directly within this window.
- The editor panel provides direct access to the SQL statement and definition of specific objects. For example, the SQL statements within a stored procedure definition are shown and edited within this panel.

26.3.3.1. Editing Tables

The Table Editor can be accessed through a mouse action on table-type node of Server Explorer. To create a new table, right click on the **TABLES** node (under the connection node) and choose the **CREATE TABLE** command from a context menu. To modify an existing table, double click on a node of the table you wish to modify, or right click on this node and choose the **ALTER TABLE** command from a context menu. Either of the commands opens the Table Editor.

The MySQL Visual Studio Plugin Table Editor is implemented in a similar fashion to the standard Query Browser Table Editor, but with minor differences.

The Table Editor consists of the following parts:

- Columns Editor — for column creation, modification and deletion.
- Indexes tab — for table/column index management.
- Foreign Keys tab — for configuration of foreign keys.
- Column Details tab — used to set advanced column options.
- Properties window — used to set table properties.

To save changes you have made in the Table Editor, use either Save or Save All buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, a confirmation dialog will be displayed to confirm that you want to update the corresponding object within the MySQL database.

26.3.3.1.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value and other properties of a table column. To set the

properties of an individual column, select the column using the mouse. Alternatively, you can move through the grid using **Tab** and **Shift+Tab** keys.

- To set or change the name, data type, default value and comment of a column, select the appropriate cell and edit the desired value.
- To set or unset flag-type column properties (i.e., primary key, **NOT NULL**, auto incremented, flags), check or uncheck the corresponding checkboxes. Note that the available column flags will depend on the columns data type.
- To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking on the selector column at the left of the column grid. Then move the column by using **Ctrl+Up** (to move the column up) and **Ctrl+Down** (to move the column down) keys.
- To delete a column, select it by clicking on the selector column at the left of the column grid, then press the **Delete** button on a keyboard.

26.3.3.1.2. Indexes tab

Index management is performed via the Indexes tab.

- To add an index, press the + button and set the properties in the **INDEX SETTINGS** groupbox at the right. You can set the index name, index kind, index type and a set of index columns.
- To remove an index, select the index from the list and press the - button.
- To change index settings, select the index from the list; detailed information about the index is displayed in the **INDEX SETTINGS** panel.

You cannot change a table column to an index column using drag and drop. Instead, you can add new index columns to a table and set their table columns by using the embedded editor within the Indexes tab

26.3.3.1.3. Foreign Keys tab

Foreign Key management is performed via the Foreign Keys tab.

- To add a foreign key, press the + button and set properties in the **FOREIGN KEYS SETTINGS** panel. You can set the foreign key name, referenced table name, foreign key columns and actions on update and delete.
- To remove a foreign key, select the foreign key and press the - button.
- To change foreign key settings, select the foreign key and use the **FOREIGN KEYS SETTINGS** panel to edit the properties.
- When a foreign key is changed, the MySQL Visual Studio Plugin generates two queries: the first query drops the changed keys and the second one recreates the new values. The reason for such a behavior is to avoid the [Bug#8377](#) and [Bug#8919](#).

Note

If changed values are for some reason inconsistent and cause the second query to fail, all affected foreign keys will be dropped. If this is the case, the MySQL Visual Studio Plugin will mark them as new in the Table Editor, and you will have to recreate them later. But if you close the Table Editor without saving, these foreign keys will be lost.

26.3.3.1.4. Column Details tab

The Column Details tab can be used to set column options. Besides the main column properties that are presented in the Column Editor, in the Column Details tab you can set two additional properties options: the character set and the collation sequence.

26.3.3.1.5. Table Properties window

There is no separate tab for table options and advanced options. All table options can be browsed and changed using the **PROPERTIES** window of Visual Studio 2005.

The following table properties can be set:

- **AUTO INCREMENT**
- **AVERAGE ROW LENGTH**
- **CHARACTER SET**
- **CHECKSUM FOR ROWS**
- **COLLATION**
- **COMMENT**
- **CONNECTION**
- **DATA DIRECTORY**
- **DELAY KEY UPDATES**
- **ENGINE**
- **INDEX DIRECTORY**
- **INSERT METHOD**
- **MAXIMUM ROWS**
- **MINIMUM ROWS**
- **NAME**
- **PACK KEYS**
- **PASSWORD**
- **ROW FORMAT**
- **UNION**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **SCHEMA** and **SERVER** are read only.

26.3.3.2. Editing Table Data

The Table Data Editor, allows a user to browse, create and edit data of tables. The Table Data Editor is implemented as a simple data grid with auto generated columns.

To access the Table Data Editor, right click on a node representing the table or view in Server Explorer. From the nodes context menu, choose the BROWSE or EEDIT DATA command. For tables and updatable views, this command opens the Table Data Editor in edit mode. For non-updatable views, this command opens the Table Data Editor in read-only mode.

When in the edit mode, you can modify table data by modifying the displayed table contents directly. To add a row, set desired values in the last row of the grid. To modify values, set new values in appropriate cells. To delete a row, select it by clicking on the selector column at the left of the grid, then press the **DELETE** button.

To save changes you have made in the Table Data Editor, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

26.3.3.3. Editing Views

To create a new view, right click the Views node under the connection node in Server Explorer. From the nodes context menu, choose the CREATE VIEW command. This command opens the SQL Editor.

To modify an existing view, double click on a node of the view you wish to modify, or right click on this node and choose the [ALTER VIEW](#) command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the view definition using SQL Editor, type the appropriate SQL statement in the SQL Editor.

Note

You should enter only the defining statement itself, without the [CREATE VIEW AS](#) preface.

All other view properties can be set in the **PROPERTIES** window. These properties are:

- **ALGORITHM**
- **CHECK OPTION**
- **DEFINER**
- **NAME**
- **SECURITY TYPE**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **IS UPDATABLE**, **SCHEMA** and **SERVER** are readonly.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

26.3.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right click the **Stored Procedures** node under the connection node in Server Explorer. From the nodes context menu, choose the [CREATE ROUTINE](#) command. This command opens the SQL Editor.

To create a new stored function, right click the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the [CREATE ROUTINE](#) command.

To modify an existing stored routine (procedure or function), double click on a node of the routine you wish to modify, or right click on this node and choose the [ALTER ROUTINE](#) command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL.

All other routine properties can be set in the **PROPERTIES** window. These properties are:

- **Comment**
- **Data Access**
- **Definer**
- **Is Deterministic**
- **Security Type**

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

Also you can set all the options directly in the SQL Editor, using the standard [CREATE PROCEDURE](#) or [CREATE FUNCTION](#) statement. However, it is recommended to use the **PROPERTIES** window instead.

Note

You should never add the [CREATE](#) preface to the routine definition.

The properties **NAME**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only. Set or change the procedure name in the SQL editor.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database..

26.3.3.5. Editing Triggers

To create a new trigger, right click on a node of a table for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double click on a node of the trigger you wish to modify, or right click on this node and choose the **ALTER TRIGGER** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the **PROPERTIES** window. These properties are:

- **DEFINER**
- **EVENT MANIPULATION**
- **NAME**
- **TIMING**

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

The properties **EVENT TABLE**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

26.3.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right click the UDFs node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an existing UDF, double click on a node of the UDF you wish to modify, or right click on this node and choose the **Alter UDF** command from a context menu. Either of the commands opens the UDF Editor.

The UDF editor allows you to set the following properties through the properties panel:

- **NAME**
- **SO-NAME (DLL NAME)**
- **RETURN TYPE**
- **IS AGGREGATE**

The property **Server** in the **PROPERTIES** window is read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

26.3.3.7. Dropping database objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate DROP command from its context menu: DROP TABLE, DROP VIEW, DROP ROUTINE, DROP TRIGGER, DROP UDF.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

26.3.3.8. Cloning database objects

Tables, views, stored procedures and functions can be cloned with the appropriate CLONE command from its context menu: CLONE TABLE, CLONE VIEW, CLONE ROUTINE. The clone commands open the corresponding editor for a new object: the **TABLE EDITOR** for cloning a table and the SQL Editor for cloning a view or a routine.

To save the cloned object, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

26.3.4. Visual Studio Plugin Support

If you have a comment, or if you discover a bug, please, use our MySQL bug tracking system (<http://bugs.mysql.com>) to report problem or add your suggestion.

26.3.4.1. Visual Studio Plugin FAQ

Questions

- [27.3.4.1.1](#): When creating a connection, typing the connection details causes the connection window to immediately close.

Questions and Answers

27.3.4.1.1: When creating a connection, typing the connection details causes the connection window to immediately close.

There are known issues with versions of Connector/NET earlier than 5.0.2. Connector/NET 1.0.x is known not to work. If you have any of these versions installed, or have previously upgraded from an earlier version, uninstall Connector/NET completely and then install Connector/NET 5.0.2.

26.4. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC-3.0 Type 4 driver, which means that is pure Java, implements version 3.0 of the JDBC specification, and communicates directly with the MySQL server using the MySQL protocol.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](#), [Spring's JDBC templates](#) or [Ibatis SQL Maps](#) to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](#) — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](#) — A more in-depth tutorial from Sun and JGuru

Key topics:

- For help with connection strings, connection options setting up your connection through JDBC, see [Section 26.4.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#).
- For tips on using Connector/J and JDBC with generic J2EE toolkits, see [Section 26.4.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#).
- Developers using the Tomcat server platform, see [Section 26.4.5.2.2, “Using Connector/J with Tomcat”](#).
- Developers using JBoss, see [Section 26.4.5.2.3, “Using Connector/J with JBoss”](#).
- Developers using Spring, see [Section 26.4.5.2.4, “Using Connector/J with Spring”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using JDBC with MySQL in the Knowledge Base articles about [JDBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

26.4.1. Connector/J Versions

There are currently four versions of MySQL Connector/J available:

- Connector/J 5.1 is current in alpha status. It provides compatibility with all the functionality of MySQL, including 4.1, 5.0, 5.1 and the 6.0 alpha release featuring the new Falcon storage engine. Connector/J 5.1 provides ease of development features, including auto-registration with the Driver Manager, standardized validity checks, categorized SQLExceptions, support for the JDBC-4.0 XML processing, per connection client information, [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types. This release also includes all bug fixes up to and including Connector/J 5.0.6.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.

The current recommended version for Connector/J is 5.0. This guide covers all three connector versions, with specific notes given where a setting applies to a specific option.

26.4.1.1. Java Versions Supported

MySQL Connector/J supports Java-2 JVMs, including:

- JDK 1.2.x (only for Connector/J 3.1.x or earlier)
- JDK 1.3.x
- JDK 1.4.x
- JDK 1.5.x

If you are building Connector/J from source using the source distribution (see [Section 26.4.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.x or newer to compile the Connector package.

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of [java.sql.Savepoint](#), Connector/J 3.1.0 and newer will not run on JDKs older than 1.4 unless the class verifier is turned off (by setting the [-Xverify:none](#) option to the Java runtime). This is because the class verifier will try to

load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

26.4.2. Connector/J Installation

You can install the Connector/J package using two methods, using either the binary or source distribution. The binary distribution provides the easiest methods for installation; the source distribution enables you to customize your installation further. With either solution, you must manually add the Connector/J location to your Java `CLASSPATH`.

26.4.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 26.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a .zip or .tar.gz archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the .class files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or a bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to extract the distribution (for example, WinZip for the .zip archive, and `tar` for the .tar.gz archive). Because there are potentially long filenames in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the .tar.gz variant of the distribution.

26.4.2.2. Installing the Driver and Configuring the CLASSPATH

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (csh, tcsh) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (sh, ksh, bash):

```
export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP and Windows Server 2003, you must set the environment variable through the System control panel.

If you want to use MySQL Connector/J with an application server such as Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 26.4.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the WEB-

INF/lib subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- `user`
- `password`
- `serverName` (see the previous section about fail-over hosts)
- `databaseName`
- `port`

26.4.2.3. Upgrading from an Older Version

MySQL AB tries to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

26.4.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, `SQLState` codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Chapter 9, Character Set Support](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 . . .`) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to `NULL` when being read from a `ResultSet`.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can get retrieve the unaltered all-zero value as a String. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 SQLState codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return SQLStates as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **`ResultSet.getString()`** — Calling `ResultSet.getString()` on a BLOB column will now return the address of the `byte[]` array that represents it, instead of a String representation of the BLOB. BLOBs have no character set, so they can't be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the TEXT types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we don't ship the .class files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

26.4.2.3.2. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

`useOldUTF8Behavior=true`

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

`useServerPrepStmts=false`

26.4.2.4. Installing from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- Subversion, to check out the sources from our repository (available from <http://subversion.tigris.org/>).
- Apache Ant version 1.6 or newer (available from <http://ant.apache.org/>).
- JDK-1.4.2 or later. Although MySQL Connector/J can be installed on older JDKs, to compile it from source you must have at least

JDK-1.4.2.

The Subversion source code repository for MySQL Connector/J is located at <http://svn.mysql.com/svnpublic/connector-j>. In general, you should not check out the entire repository because it contains every branch and tag for MySQL Connector/J and is quite large.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. At the time of this writing, there are three active branches of Connector/J: `branch_3_0`, `branch_3_1` and `branch_5_0`. Check out the latest code from the branch that you want with the following command (replacing `[major]` and `[minor]` with appropriate version numbers):

```
shell> svn co »
http://svn.mysql.com/svnpublic/connector-j/branches/branch_[major]_[minor]/connector-j
```

This creates a `connector-j` subdirectory in the current directory that contains the latest sources for the requested branch.

2. Change location to the `connector-j` directory to make it your current working directory:

```
shell> cd connector-j
```

3. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant --projecthelp
```

4. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 26.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#).

26.4.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 26.1, “Obtaining a connection from the DriverManager”](#)
- [Example 26.2, “Using java.sql.Statement to execute a SELECT query”](#)
- [Example 26.3, “Stored Procedures”](#)
- [Example 26.4, “Using Connection.prepareStatement\(\)”](#)
- [Example 26.5, “Registering output parameters”](#)
- [Example 26.6, “Setting CallableStatement input parameters”](#)
- [Example 26.7, “Retrieving results and output parameter values”](#)
- [Example 26.8, “Retrieving AUTO_INCREMENT column values using Statement.getGeneratedKeys\(\)”](#)
- [Example 26.9, “Retrieving AUTO_INCREMENT column values using SELECT LAST_INSERT_ID\(\)”](#)
- [Example 26.10, “Retrieving AUTO_INCREMENT column values in Updatable ResultSets”](#)

- [Example 26.11, “Using a connection pool with a J2EE application server”](#)
- [Example 26.12, “Example of transaction with retry logic”](#)

26.4.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

26.4.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][, failoverhost...][:port]/[database] »  
[?propertyName1[=propertyValue1]&propertyName2[=propertyValue2]...
```

If the hostname is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »  
[?propertyName1[=propertyValue1]&propertyName2[=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the Connection instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is false: Failover only happens at connection initialization, and fallback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is true: Failover happens when the driver determines that the connection has failed (before *every* query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`
 - `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`

- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource.setURL()` method.

Note

If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&` to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all versions
password	The password to use when connecting		all versions
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface 'com.mysql.jdbc.SocketFactory' and have public no-args constructor.	com.mysql.jdbc.StandardSocketFactory	3.0.3
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to '0'.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. These configurations are explained in the 'Configurations' of the documentation.		3.1.5
interactiveClient	Set the CLIENT_INTERACTIVE flag, which tells MySQL to timeout connections based on INTERACTIVE_TIMEOUT instead of WAIT_TIMEOUT	false	3.1.0
localSocketAddress	Hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.		5.0.5
propertiesTransform	An implementation of com.mysql.jdbc.ConnectionPropertiesTransform that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to 'false'.	false	3.0.17

Networking.

Property Name	Definition	Default Value	Since Version
tcpKeepAlive	If connecting using TCP/IP, should the driver set SO_KEEPALIVE?	true	5.0.7
tcpNoDelay	If connecting using TCP/IP, should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm)?	true	5.0.7
tcpRcvBuf	If connecting using TCP/IP, should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpSndBuf	If connecting using TCP/IP, should the driver set SO_SND_BUF	0	5.0.7

	to the given value? The default value of '0', means use the platform default value for this property)		
tcpTrafficClass	If connecting using TCP/IP, should the driver set traffic class or type-of-service fields ?See the documentation for <code>java.net.Socket.setTrafficClass()</code> for more information.	0	5.0.7

High Availability and Clustering.

Property Name	Definition	Default Value	Since Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don't handle <code>SQLExceptions</code> properly, and is only designed to be used when you are unable to configure your application to handle <code>SQLExceptions</code> resulting from dead and stale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout" to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
maxReconnects	Maximum number of reconnects to attempt if autoReconnect is true, default is '3'.	3	1.1
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnects at the end of every transaction?	false	3.0.10
initialTimeout	If autoReconnect is enabled, the initial time to wait between reconnect attempts (in seconds, defaults to '2').	2	1.1
roundRobinLoadBalance	When autoReconnect is enabled, and failoverReadonly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting	30	3.0.2
resourceId	A globally unique name that identifies the resource that this data-source or connection is connected to, used for <code>XAResource.isSameRM()</code> when the driver can't determine this value based on hostnames used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false), defaults to 'false'	false	3.1.1
useSSL	Use SSL when communicating with the server (true/false), defaults to 'false'	false	3.0.2
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0

allowLoadLocalInfile	Should the driver allow use of 'LOAD DATA LOCAL INFILE...' (defaults to 'true').	true	3.0.3
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
clientCertificateKeyStorePassword	Password for the client certificates KeyStore		5.1.0
clientCertificateKeyStoreType	KeyStore type for client certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
clientCertificateKeyStoreUrl	URL to the client certificate KeyStore (if not specified, use defaults)		5.1.0
trustCertificateKeyStorePassword	Password for the trusted root certificates KeyStore		5.1.0
trustCertificateKeyStoreType	KeyStore type for trusted root certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
trustCertificateKeyStoreUrl	URL to the trusted root certificate KeyStore (if not specified, use defaults)		5.1.0
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

Performance Extensions.

Property Name	Definition	Default Value	Since Version
callableStmtCacheSize	If 'cacheCallableStmts' is enabled, how many callable statements should be cached?	100	3.1.2
metadataCacheSize	The number of queries to cache ResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
alwaysSendSetIsolation	Should the driver always communicate with the database when Connection.setTransactionIsolation() is called? If set to false, the driver will only communicate with the database when the requested transaction isolation is different than the whichever is newer, the last value that was set via Connection.setTransactionIsolation(), or the value that was read from the server when the connection was established.	true	3.1.7
maintainTimeStats	Should the driver maintain various internal timers to enable idle time calculations as well as more verbose error messages when the connection to the server fails? Setting this property to false removes at least two calls to System.currentTimeMillis() per query.	true	3.1.9
useCursorFetch	If connected to MySQL > 5.0.2, and setFetchSize() > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of	false	3.0.10

	client-side prepared statements, the "check" for suitability of server-side prepared and server-side prepared statements themselves?		
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of 'SHOW VARIABLES' and 'SHOW COLLATION' on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call setFetchSize(n) with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling close() on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar when required, or cache it per connection/session?	false	3.1.5
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by Connection.setAutoCommit(boolean)?	false	3.1.3
enableQueryTimeouts	When enabled, query timeouts set via Statement.setQueryTimeout() use a shared java.util.Timer instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the TimerTask for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality.	true	5.0.6
holdResultsOpenOverStatementClose	Should the driver close result sets on Statement.close() as required by the JDBC specification?	false	3.1.7
largeRowSizeThreshold	What size result set row should the JDBC driver consider "large", and thus use a more memory-efficient way of representing the row internally?	2048	5.1.1
loadBalanceStrategy	If using a load-balanced connection to connect to SQL nodes in a MySQL Cluster/NDB configuration (by using the URL prefix "jdbc:mysql:loadbalance://"), which load balancing algorithm should the driver use: (1) "random" - the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload. (2) "bestResponseTime" - the driver will route the request to the host that had the best response time for the previous transaction.	random	5.0.6
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for getBinaryInputStream?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of "allowMultiQueries") as well as rewriting of prepared statements for INSERT into multi-value inserts when executeBatch() is called? Notice that this has the potential for SQL injection if using plain java.sql.Statements and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using PreparedStatement.set*Stream(), the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. Statement.getGeneratedKeys() for these rewritten statements only works when the entire batch includes INSERT statements.	false	3.1.13

useDirectRowUnpack	Use newer result set row unpacking code that skips a copy from network buffers to a MySQL packet instance and instead reads directly into the result set row data buffers.	true	5.1.1
useDynamicCharsetInfo	Should the driver use a per-connection cache of character set information queried from the server when necessary, or use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver?	true	5.0.6
useFastDateParsing	Use internal String->Date/Time/Timestamp conversion routines to avoid excessive object creation?	true	5.0.5
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets?	false	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by Connection.setAutoCommit() and Connection.setTransactionIsolation() and transaction state as maintained by the protocol, rather than querying the database or blindly sending commands to the database for commit() or rollback() method calls?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements "com.mysql.jdbc.log.Log" that will be used to log messages to. (default is "com.mysql.jdbc.log.StandardLogger", which logs to STDERR)	com.mysql.jdbc.log.StandardLogger	3.1.1
gatherPerfMetrics	Should the driver gather performance metrics, and report them via the configured logger every 'reportMetricsIntervalMillis' milliseconds?	false	3.1.2
profileSQL	Trace queries and their execution/fetch times to the configured logger (true/false) defaults to 'false'	false	3.1.0
profileSql	Deprecated, use 'profileSQL' instead. Trace queries and their execution/fetch times on STDERR (true/false) defaults to 'false'		2.0.14
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
slowQueryThresholdNanos	If 'useNanosForElapsedTime' is set to true, and this property is set to a non-zero value, the driver will use this threshold (in nano-second units) to determine if a query was slow.	0	5.0.7
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
clientInfoProvider	The name of a class that implements the	com.mysql.j	5.1.0

	com.mysql.jdbc.JDBC4ClientInfoProvider interface in order to support JDBC-4.0's Connection.getClientInfo() methods	dbc.JDBC4 CommentClientInfoProvider	
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
includeInnodbStatusInDeadlockExceptions	Include the output of "SHOW ENGINE INNODB STATUS" in exception messages when deadlock exceptions are detected?	false	5.0.7
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
logXaCommands	Should the driver log XA commands sent by MysqlXaConnection to the server, at the DEBUG level of logging?	false	5.0.5
resultSetSizeThreshold	If the usage advisor is enabled, how many rows should a result set contain before the driver warns that it is suspiciously large?	100	5.0.5
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2
useNanosForElapsedTime	For profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (JDK >= 1.5)?	false	5.0.7

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver can't determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set collation_connection'		3.0.13
useBlobToStoreUTF8OutsideBMP	Tells the driver to treat [MEDIUM/LONG]BLOB columns as [LONG]VARCHAR columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.	false	5.1.3
utf8OutsideBmpExcludedColumnNamePattern	When "useBlobToStoreUTF8OutsideBMP" is set to "true", column names matching the given regex will still be treated as BLOBs unless they match the regex specified for "utf8OutsideBmpIncludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
utf8OutsideBmpIncludedColumnNamePattern	Used to specify exclusion rules to "utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
sessionVariables	A comma-separated list of name/value pairs to be sent as SET		3.1.8

	SESSION ... to the server when the driver connects.		
allowNaNAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
blobsAreStrings	Should the driver always treat BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	false	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	Should the driver emulate java.sql.Blobs with locators? With this feature enabled, the driver will delay loading the actual Blob data until the one of the retrieval methods (getInputStream(), getBytes(), and so forth) on the blob data stream has been accessed. For this to work, you must use a column alias with the value of the column to the actual name of the Blob. The feature also has the following restrictions: The SELECT that created the result set must reference only one table, the table must have a primary key; the SELECT must alias the original blob column name, specified as a string, to an alternate name; the SELECT must cover all columns that make up the primary key.	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
functionsNeverReturnBlobs	Should the driver always treat data from functions returning BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
generateSimpleParameterMetadata	Should the driver generate simplified parameter metadata for PreparedStatements when no metadata is available either because the server couldn't support preparing the statement, or server-side prepared statements are disabled?	false	5.0.5
ignoreNonTxTables	Ignore non-transactional table warning for rollback? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings (MySQL 4.1.0 and newer)? This property has no effect if the server sql-mode includes STRICT_TRANS_TABLES.	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions

netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver will not try and adjust this value)	600	5.1.0
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Don't ensure that ResultSet.getString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaMethods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaMethods.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test suite	false	3.1.7

	version 1.3		
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
statementInterceptors	A comma-delimited list of classes that implement "" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in the chain, from left-to-right order, as specified in this property.		5.1.1
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyInt1isBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior.	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in Database-MetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSet-MetaData.getColumnNames() or ResultSet-MetaData.getTableName() rather than the original column/table name?	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimezoneShift" set to "true", use compatible behavior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.	false	5.0.5
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2

useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to represent invalid dates)? Valid values are "exception", "round" and "convertToNull".	exception	3.1.4

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory via the socketFactory property. If you don't use a namedPipePath property, the default of '\\.\pipe\MySQL' will be used. If you use the [NamedPipeSocketFactory](#), the hostname and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access.

You can create your own socket factories by following the example code in [com.mysql.jdbc.NamedPipeSocketFactory](#), or [com.mysql.jdbc.StandardSocketFactory](#).

26.4.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods ([getInputStream\(\)](#), [getBytes\(\)](#), and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The **SELECT** must also reference only one table, the table must have a primary key.
- The **SELECT** must alias the original blob column name, specified as a string, to an alternate name.
- The **SELECT** must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the [DatabaseMetaData.locatorsUpdateCopies\(\)](#) method). Because of this, you should use the corresponding [PreparedStatement.setBlob\(\)](#) or [ResultSet.updateBlob\(\)](#) (in the case of updatable result sets) methods to save changes back to the database.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about type conversion in the Knowledge Base article, [Type Conversions Supported by MySQL Connector/J](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()/getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and can't be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,  
                             java.sql.ResultSet.CONCUR_READ_ONLY);  
stmt.setFetchSize(Integer.MIN_VALUE);
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be `MyISAM` table-level locks or row-level locks in some other storage engine such as `InnoDB`) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

Note

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

26.4.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
CHAR, VARCHAR, BLOB, TEXT, ENUM, and SET	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
FLOAT, REAL, DOUBLE PRECISION, NUMERIC, DECIMAL, TINYINT, SMALLINT, MEDIUMINT, INTEGER, BIGINT	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
DATE, TIME, DATETIME, TIMESTAMP	<code>java.lang.String</code> , <code>java.sql.Date</code> , <code>java.sql.Timestamp</code>

Note

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>getColumnClassName</code>	Returned as Java Class
BIT(1) (new in MySQL-5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL-5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyInt1isBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
INT, INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D))]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).

VARCHAR(M) [BINARY]	VARCHAR	java.lang.String (unless the character set for the column is BINARY, then byte[] is returned).
BINARY(M)	BINARY	byte[]
VARBINARY(M)	VARBINARY	byte[]
TINYBLOB	TINYBLOB	byte[]
TINYTEXT	VARCHAR	java.lang.String
BLOB	BLOB	byte[]
TEXT	VARCHAR	java.lang.String
MEDIUMBLOB	MEDIUMBLOB	byte[]
MEDIUMTEXT	VARCHAR	java.lang.String
LOBLOB	LOBLOB	byte[]
LONGTEXT	VARCHAR	java.lang.String
ENUM('value1','value2',...)	CHAR	java.lang.String
SET('value1','value2',...)	CHAR	java.lang.String

26.4.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent via [Statement.execute\(\)](#), [Statement.executeUpdate\(\)](#), [Statement.executeQuery\(\)](#) as well as all [PreparedStatement](#) and [CallableStatement](#) parameters with the exclusion of parameters set using [setBytes\(\)](#), [setBinaryStream\(\)](#), [setAsciiStream\(\)](#), [setUnicodeStream\(\)](#) and [setBlob\(\)](#).

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the [useUnicode](#) and [characterEncoding](#) properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in [ResultSets](#).

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the [character_set](#) system variable for server versions older than 4.1.0 and [character_set_server](#) for server versions 4.1.0 and newer. For more information, see [Section 9.3.1, “Server Character Set and Collation”](#).

To override the automatically-detected encoding on the client side, use the [characterEncoding](#) property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7

hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

26.4.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.8.7, “Using Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the `SSL` subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
               -file cacert.pem -keystore truststore
```

Keytool will respond with the following information:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=walrus,
      O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=walrus,
        O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
  Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
  MD5:  61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
  SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
```

Certificate was added to keystore

You will then need to generate a client certificate, so that the MySQL server knows that it is talking to a secure client:

```
shell> keytool -genkey -keyalg rsa \
  -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named **keystore** in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y
Enter key password for <mysqlClientCertificate>
(RETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password
```

Or you can set the values directly within the application:

```
System.setProperty("javax.net.ssl.keyStore", "path_to_keystore_file");
System.setProperty("javax.net.ssl.keyStorePassword", "password");
System.setProperty("javax.net.ssl.trustStore", "path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword", "password");
```

You will also need to set `useSSL` to **true** in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to **true** in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```

JSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all`. This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

26.4.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```

import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
        Connection conn =
            driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
                props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //
        conn.setReadOnly(false);
        conn.setAutoCommit(false);
    }
}

```

```

conn.createStatement().executeUpdate("UPDATE some_table ...");
conn.commit();

//
// Now, do a query from a slave, the driver automatically picks one
// from the list
//

conn.setReadOnly(true);

ResultSet rs =
    conn.createStatement().executeQuery("SELECT a,b FROM alt_table");
    .....
}
}

```

26.4.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

Table 26.1. Mapping of MySQL Error Numbers to SQLStates

26.4.5. Connector/J Notes and Tips

26.4.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

26.4.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 26.1. Obtaining a connection from the `DriverManager`

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

...
try {
    Connection conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test?" +
                                   "user=monty&password=greatsqlldb");

    // Do something with the Connection

} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

26.4.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you don't know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 26.2. Using `java.sql.Statement` to execute a `SELECT` query

```
// assume that conn is an already created JDBC connection
Statement stmt = null;
ResultSet rs = null;

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
} finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed
```

```

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) { // ignore }
        rs = null;
    }
    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) { // ignore }
        stmt = null;
    }
}

```

26.4.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

Example 26.3. Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                        INOUT inOutParam INT)
BEGIN
    DECLARE z INT;
    SET z = inOutParam + 1;
    SET inOutParam = z;

    SELECT inputParam;

    SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

Example 26.4. Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;

...

//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//

CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

```

```
cStmt.setString(1, "abcdefg");
```

Note

`Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 26.5. Registering output parameters

```
import java.sql.Types;
...
//
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);
//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

Example 26.6. Setting `CallableStatement` input parameters

```
...
//
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");
//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");
```

```

//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);

//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);

...

```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 26.7. Retrieving results and output parameter values

```

...

boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//
while (hadResults) {
    ResultSet rs = cStmt.getResultSet();

    // process result set
    ...

    hadResults = rs.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//

int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based

...

```

26.4.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 26.8. Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```

Statement stmt = null;
ResultSet rs = null;

```

```

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                                java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //
    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //
    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')",
        Statement.RETURN_GENERATED_KEYS);

    //
    // Example of using Statement.getGeneratedKeys()
    // to retrieve the value of an auto-increment
    // value
    //
    int autoIncKeyFromApi = -1;
    rs = stmt.getGeneratedKeys();
    if (rs.next()) {
        autoIncKeyFromApi = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();
    rs = null;

    System.out.println("Key returned from getGeneratedKeys(): "
        + autoIncKeyFromApi);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 26.9. Retrieving **AUTO_INCREMENT** column values using **SELECT LAST_INSERT_ID()**

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets.

```

```

    stmt = conn.createStatement();

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')");

    //
    // Use the MySQL LAST_INSERT_ID()
    // function to do the same thing as getGeneratedKeys()
    //

    int autoIncKeyFromFunc = -1;
    rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

    if (rs.next()) {
        autoIncKeyFromFunc = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();

    System.out.println("Key returned from " +
        "'SELECT LAST_INSERT_ID()': " +
        autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 26.10. Retrieving **AUTO_INCREMENT** column values in **Updatable ResultSets**

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
        java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");

```

```

stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial ("
    + "priKey INT NOT NULL AUTO_INCREMENT, "
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Example of retrieving an AUTO INCREMENT key
// from an updatable result set
//

rs = stmt.executeQuery("SELECT priKey, dataField "
    + "FROM autoIncTutorial");

rs.moveToInsertRow();

rs.updateString("dataField", "AUTO INCREMENT here?");
rs.insertRow();

//
// the driver adds rows at the end
//

rs.last();

//
// We should now be on the row we just inserted
//

int autoIncKeyFromRS = rs.getInt("priKey");
rs.close();

rs = null;

System.out.println("Key returned for inserted row: "
    + autoIncKeyFromRS);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

26.4.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

26.4.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

26.4.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transac-

tion, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you don't use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 26.11. Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */
    }
}
```

```

InitialContext ctx = new InitialContext();

/*
 * Lookup the DataSource, which will be backed by a pool
 * that the application server provides. DataSource instances
 * are also a good candidate for caching as an instance
 * variable, as JNDI lookups can be expensive as well.
 */

DataSource ds =
    (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

/*
 * The following code is what would actually be in your
 * Servlet, JSP or EJB 'service' method...where you need
 * to work with a JDBC connection.
 */

Connection conn = null;
Statement stmt = null;

try {
    conn = ds.getConnection();

    /*
     * Now, use normal JDBC programming to work with
     * MySQL, making sure to close each resource when you're
     * finished with it, which allows the connection pool
     * resources to be recovered as quickly as possible
     */

    stmt = conn.createStatement();
    stmt.execute("SOME SQL QUERY");

    stmt.close();
    stmt = null;

    conn.close();
    conn = null;
} finally {
    /*
     * close any jdbc instances here that weren't
     * explicitly closed during normal code path, so
     * that we don't 'leak' resources...
     */

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlex) {
            // ignore -- as we can't do anything about it here
        }

        stmt = null;
    }

    if (conn != null) {
        try {
            conn.close();
        } catch (SQLException sqlex) {
            // ignore -- as we can't do anything about it here
        }

        conn = null;
    }
}
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What's the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users)

using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

26.4.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://jakarta.apache.org/tomcat/tomcat-5.0-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```
<Context ....>
...
<Resource name="jdbc/MySQLDB"
          auth="Container"
          type="javax.sql.DataSource"/>
<!-- The name you used above, must match _exactly_ here!
      The connection pool will be bound into JNDI with the name
      "java:/comp/env/jdbc/MySQLDB"
-->
<ResourceParams name="jdbc/MySQLDB">
  <parameter>
    <name>factory</name>
    <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
  </parameter>
  <!-- Don't set this any higher than max_connections on your
        MySQL server, usually this should be a 10 or a few 10's
        of connections, not hundreds or thousands -->
  <parameter>
    <name>maxActive</name>
    <value>10</value>
  </parameter>
  <!-- You don't want to many idle connections hanging around
        if you can avoid it, only enough to soak up a spike in
        the load -->
  <parameter>
    <name>maxIdle</name>
    <value>5</value>
  </parameter>
  <!-- Don't use autoReconnect=true, it's going away eventually
        and it's a crutch for older connection pools that couldn't
        test connections. You need to decide whether your application
        is supposed to deal with SQLExceptions (hint, it should), and
        how much of a performance penalty you're willing to pay
        to ensure 'freshness' of the connection -->
  <parameter>
    <name>validationQuery</name>
    <value>SELECT 1</value>
  </parameter>
  <!-- The most conservative approach is to test connections
        before they're given to your application. For most applications
        this is okay, the query used above is very small and takes
        no real server resources to process, other than the time used
        to traverse the network.
        If you have a high-load application you'll need to rely on
        something else. -->
  <parameter>
    <name>testOnBorrow</name>
```

```

    <value>true</value>
  </parameter>

  <!-- Otherwise, or in addition to testOnBorrow, you can test
    while connections are sitting idle -->

  <parameter>
    <name>testWhileIdle</name>
    <value>true</value>
  </parameter>

  <!-- You have to set this value, otherwise even though
    you've asked connections to be tested while idle,
    the idle evictor thread will never run -->

  <parameter>
    <name>timeBetweenEvictionRunsMillis</name>
    <value>10000</value>
  </parameter>

  <!-- Don't allow connections to hang out idle too long,
    never longer than what wait_timeout is set to on the
    server...A few minutes or even fraction of a minute
    is sometimes okay here, it depends on your application
    and how much spikey load it will see -->

  <parameter>
    <name>minEvictableIdleTimeMillis</name>
    <value>60000</value>
  </parameter>

  <!-- Username and password used when connecting to MySQL -->

  <parameter>
    <name>username</name>
    <value>someuser</value>
  </parameter>

  <parameter>
    <name>password</name>
    <value>somepass</value>
  </parameter>

  <!-- Class name for the Connector/J driver -->

  <parameter>
    <name>driverClassName</name>
    <value>com.mysql.jdbc.Driver</value>
  </parameter>

  <!-- The JDBC connection url for connecting to MySQL, notice
    that if you want to pass any other MySQL-specific parameters
    you should pass them here in the URL, setting them using the
    parameter tags above will have no effect, you will also
    need to use & to separate parameter values as the
    ampersand is a reserved character in XML -->

  <parameter>
    <name>url</name>
    <value>jdbc:mysql://localhost:3306/test</value>
  </parameter>
</ResourceParams>
</Context>

```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure datasources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```

Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null

```

26.4.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the [lib](#) directory for your server configuration (which is usually called [default](#)). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with "-ds.xml", which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
      "java:/MySQLDB" -->

```

```

<jndi-name>MySQLDB</jndi-name>
<connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
<driver-class>com.mysql.jdbc.Driver</driver-class>
<user-name>user</user-name>
<password>pass</password>

<min-pool-size>5</min-pool-size>

<!-- Don't set this any higher than max_connections on your
MySQL server, usually this should be a 10 or a few 10's
of connections, not hundreds or thousands -->

<max-pool-size>20</max-pool-size>

<!-- Don't allow connections to hang out idle too long,
never longer than what wait_timeout is set to on the
server...A few minutes is usually okay here,
it depends on your application
and how much spikey load it will see -->

<idle-timeout-minutes>5</idle-timeout-minutes>

<!-- If you're using Connector/J 3.1.8 or newer, you can use
our implementation of these to increase the robustness
of the connection pool. -->

<exception-sorter-class-name>
com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
</exception-sorter-class-name>
<valid-connection-checker-class-name>
com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
</valid-connection-checker-class-name>

</local-tx-datasource>
</datasources>

```

26.4.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to setup a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```

<util:map id="dbProps">
  <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
  <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>
  <entry key="db.username" value="myuser"/>
  <entry key="db.password" value="mypass"/>
</util:map>

```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```

<bean id="dataSource"
  class="org.springframework.jdbc.datasource.DriverManagerDataSource">
  <property name="driverClassName" value="${db.driver}"/>
  <property name="url" value="${db.jdbcurl}"/>
  <property name="username" value="${db.username}"/>
  <property name="password" value="${db.password}"/>
</bean>

```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```

<bean
  class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">

```

```
<property name="properties" ref="dbProps"/>
</bean>
```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```
// Create a new application context. this processes the Spring config
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex1appContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
    // retrieve a list of three random cities
    PreparedStatement ps = c.prepareStatement(
        "select City.Name as 'City', Country.Name as 'Country' " +
        "from City inner join Country on City.CountryCode = Country.Code " +
        "order by rand() limit 3");
    ResultSet rs = ps.executeQuery();
    while(rs.next()) {
        String city = rs.getString("City");
        String country = rs.getString("Country");
        System.out.printf("The city %s is in %s\n", city, country);
    }
} catch (SQLException ex) {
    // something has failed and we print a stack trace to analyse the error
    ex.printStackTrace();
    // ignore failure closing connection
    try { c.close(); } catch (SQLException e) { }
} finally {
    // properly release our connection
    DataSourceUtils.releaseConnection(c, ds);
}
```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way similar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

26.4.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```
public class Ex2JdbcDao {
    /**
     * Data source reference which will be provided by Spring.
     */
    private DataSource dataSource;

    /**
     * Our query to find a random city given a country code. Notice
     * the ":country" parameter towards the end. This is called a
     * named parameter.
     */
    private String queryString = "select Name from City " +
        "where CountryCode = :country order by rand() limit 1";

    /**
     * Retrieve a random city using Spring JDBC access classes.
     */
    public String getRandomCityByCountryCode(String centryCode) {
        // A template that allows using queries with named parameters
        NamedParameterJdbcTemplate template =
            new NamedParameterJdbcTemplate(dataSource);
        // A java.util.Map is used to provide values for the parameters
        Map params = new HashMap();
        params.put("country", centryCode);
        // We query for an Object and specify what class we are expecting
        return (String)template.queryForObject(queryString, params, String.class);
    }
}
```

```

/**
 * A JavaBean setter-style method to allow Spring to inject the data source.
 * @param dataSource
 */
public void setDataSource(DataSource dataSource) {
    this.dataSource = dataSource;
}
}

```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `Named-ParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```

<bean id="dao" class="code.Ex2JdbcDao">
  <property name="dataSource" ref="dataSource"/>
</bean>

```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```

// Create the application context
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
    System.out.printf("A random city in %s is %s\n", countryCode,
        dao.getRandomCityByCountryCode(countryCode));

```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including `Connection` and `PreparedStatement`.

26.4.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we don't deal directly with the JDBC classes. Spring provides a transaction management package that not only replaces JDBC transaction management, but also allows declarative transaction management (configuration instead of code).

In order to use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```

ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
ALTER TABLE CountryLanguage ENGINE=InnoDB;

```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```

public interface Ex3Dao {
    Integer createCity(String name, String countryCode,
        String district, Integer population);
}

```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```

public class Ex3DaoImpl implements Ex3Dao {
    protected DataSource dataSource;
    protected SqlUpdate updateQuery;
    protected SqlFunction idQuery;
}

```

```

    public Integer createCity(String name, String countryCode,
        String district, Integer population) {
        updateQuery.update(new Object[] { name, countryCode,
            district, population });
        return getLastId();
    }

    protected Integer getLastId() {
        return idQuery.run();
    }
}

```

You can see that we only operate on abstract query objects here and don't deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```

<bean id="dao" class="code.Ex3DaoImpl">
    <property name="dataSource" ref="dataSource"/>
    <property name="updateQuery">...</property>
    <property name="idQuery">...</property>
</bean>

```

Now you need to setup the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for for the [dao](#) methods.

```

<bean id="transactionManager"
    class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
    <property name="dataSource" ref="dataSource"/>
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
    <tx:attributes>
        <tx:method name="*" />
    </tx:attributes>
</tx:advice>

```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The [txAdvice](#) uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```

<aop:config>
    <aop:pointcut id="daoMethods"
        expression="execution(* code.Ex3Dao.*(..))"/>
    <aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods"/>
</aop:config>

```

This basically says that all methods called on the [Ex3Dao](#) interface will be wrapped in a transaction. To make use of this, you only have to retrieve the [dao](#) from the application context and call a method on the [dao](#) instance.

```

Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);

```

We can verify from this that there is no transaction management happening in our Java code and it's all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

26.4.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and setup the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the [TIME_WAIT](#) state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on [DriverManagerDataSource](#) with DBCP's [BasicDataSource](#).

```

<bean id="dataSource" destroy-method="close"
    class="org.apache.commons.dbcp.BasicDataSource">
    <property name="driverClassName" value="${db.driver}"/>
    <property name="url" value="${db.jdbcurl}"/>
    <property name="username" value="${db.username}"/>
    <property name="password" value="${db.password}"/>
    <property name="initialSize" value="3"/>
</bean>

```

```
</bean>
```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the server/default/deploy directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS"/>
```

26.4.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- [27.4.5.3.1](#): When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

- [27.4.5.3.2](#): My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [27.4.5.3.3](#): I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [27.4.5.3.4](#): I have a servlet/application that works fine for a day, and then stops working overnight
- [27.4.5.3.5](#): I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- [27.4.5.3.6](#): I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- [27.4.5.3.7](#): I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MySQLIO.readFully(MySQLIO.java:1392)
at com.mysql.jdbc.MySQLIO.readPacket(MySQLIO.java:1414)
at com.mysql.jdbc.MySQLIO.doHandshake(MySQLIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

- [27.4.5.3.8](#): My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.
- [27.4.5.3.9](#): When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.

- [27.4.5.3.10](#): Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.

Questions and Answers

27.4.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the `GRANT` statement to your MySQL Server. See [Section 12.5.1.3, “GRANT Syntax”](#), for more information.

Note

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special hostname `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the hostname instead.

Warning

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

27.4.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 26.4.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using DriverManager, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

27.4.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the `--skip-networking` option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the `.class` files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the `--skip-networking` flag, or if it is firewalled.

If MySQL has been started with the `--skip-networking` option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` direct-

ory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by MySQL AB always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

27.4.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 26.4.4.1, "Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J"](#)).

Also, you should be catching `SQLExceptions` in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see [`java.sql.SQLException.getSQLState\(\)`](#) in your APIDocs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 26.12. Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transactional storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";

            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;

            stmt.close();
            stmt = null;

            conn.commit();
            conn.close();
            conn = null;

            transactionCompleted = true;
        } catch (SQLException sqlEx) {
```

```

//
// The two SQL states that are 'retry-able' are 08S01
// for a communications error, and 40001 for deadlock.
//
// Only retry if the error was due to a stale connection,
// communications problem or deadlock
//
String sqlState = sqlEx.getSQLState();

if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
    retryCount--;
} else {
    retryCount = 0;
}
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this . . .
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this as well . . .
        }
    }

    if (conn != null) {
        try {
            //
            // If we got here, and conn is not null, the
            // transaction should be rolled back, as not
            // all work has been done

            try {
                conn.rollback();
            } finally {
                conn.close();
            }
        } catch (SQLException sqlEx) {
            //
            // If we got an exception here, something
            // pretty serious is going on, so we better
            // pass it up the stack, rather than just
            // logging it. . .
            throw sqlEx;
        }
    }
}
} while (!transactionCompleted && (retryCount > 0));
}

```

Note

Use of the [autoReconnect](#) option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The [autoReconnect](#) facility is deprecated, and may be removed in a future release.

27.4.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using [UPDATE](#) or [DELETE](#) statements on a table where you can individually specify the criteria to be matched using a [WHERE](#) clause.

27.4.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the [skip-networking](#) option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section B.1.2.2, “Can't connect to \[local\] MySQL server”](#).

27.4.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MySQLIO.readFully(MySQLIO.java:1392)
at com.mysql.jdbc.MySQLIO.readPacket(MySQLIO.java:1414)
at com.mysql.jdbc.MySQLIO.doHandshake(MySQLIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

The error probably indicates that you are using an older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying to connect to a MySQL server with version 4.1.x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your [CLASSPATH](#) includes the older Connector/J package.

27.4.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the [TransactionTimeout](#) attribute to the [TransactionManagerService](#) within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See [Transaction-Timeout](#) within the JBoss wiki for more information.

27.4.5.3.9: When using gcj an java.io.CharConversionException is raised when working with certain character sequences.

This is a known issue with [gcj](#) which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the [gcj](#) libraries, or try a different JDK.

27.4.5.3.10: Updating a table that contains a primary key that is either FLOAT or compound primary key that uses FLOAT fails to update the table and raises an exception.

Connector/J adds conditions to the [WHERE](#) clause during an [UPDATE](#) to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use [FLOAT](#). If you have to use a floating point column in your primary key use [DOUBLE](#) or [DECIMAL](#) types in place of [FLOAT](#).

26.4.6. Connector/J Support

26.4.6.1. Connector/J Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2](#), “MySQL Community Support at the MySQL Forums”.

26.4.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to security_at_mysql.com.

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you don't waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details don't matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, “Why doesn't this work for me?” Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (i.e. there's more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from `'jdbc:mysql:///test'`, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

26.4.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.5, “MySQL Connector/J Change History”](#).

26.5. MySQL Connector/MXJ

MySQL Connector/MXJ is a solution for deploying the MySQL database engine (`mysqld`) intelligently from within a Java package.

26.5.1. Introduction to Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

26.5.1.1. Connector/MXJ Versions

Connector/MX

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

The exact version of `mysqld` included depends on the version of Connector/MXJ

- Connector/MXJ v5.0.3 included MySQL v5.0.22
 - Connector/MXJ v5.0.4 includes MySQL v5.0.27 (Community) or MySQL v5.0.32 (Enterprise)
 - Connector/MXJ v5.0.6 includes MySQL 5.0.37 (Community)
- Connector/MXJ 1.x includes `mysqld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

26.5.1.2. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directed. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

26.5.2. Connector/MXJ Installation

Connector/MXJ does not have an installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

26.5.2.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqlld` binary for a select number of platforms, as outlined below.

- Linux, i386
- Windows NT, Windows 2000, Windows XP, x86
- Solaris 8, SPARC 32 (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X, PowerPC

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 26.5.5.1, “Creating your own Connector/MXJ Package”](#)

26.5.2.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `connector-mxj`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`

1. `connector-mxj.jar` — contains the main Connector/MXJ classes.

2. `connector-mxj-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `connector-j.jar` — Connector/J, see [Section 26.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

1. `connector-mxj.jar`
2. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
3. `connector-j.jar` — Connector/J, see [Section 26.4, “MySQL Connector/J”](#).

26.5.2.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the [ConnectorMXJUrlTestExample](#):

```
java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/test?serverbasedir=/var/tmp/test-mxj
[MysqldResource] launching mysqld (getOptions)
[/var/tmp/test-mxj/bin/mysqld][--no-defaults] »
[--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid] »
[--socket=mysql.sock][--datadir=/var/tmp/test-mxj/data] »
[--port=3336][--basedir=/var/tmp/test-mxj]
[MysqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
060726 15:40:42 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
060726 15:40:44 InnoDB: Started; log sequence number 0 0
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.22-max' socket: 'mysql.sock' port: 3336 MySQL Community Edition - Experimental (GPL)
[MysqldResource] mysqld running as process: 1210
-----
5.0.22-max
-----
[MysqldResource] stopping mysqld (process: 1210)
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

060726 15:40:45 InnoDB: Starting shutdown...
060726 15:40:48 InnoDB: Shutdown completed; log sequence number 0 43655
060726 15:40:48 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] clearing options
[MysqldResource] shutdown complete
```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

26.5.2.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `connector-mxj.jar` to the `CLASSPATH`.

If you are using Connector/MXJ v5.0.4 or later you will also need to add the `connector-mxj-db-files.jar` file to your `CLASSPATH`.

2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DBNAME`.

For more details, see [Section 26.5.3, “Connector/MXJ Configuration”](#).

26.5.2.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `connector-mxj.jar` file to the `$JBOSS_HOME/server/default/lib` directory.

If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `connector-mxj-db-files.jar` file to `$JBOSS_HOME/server/default/lib`.

2. Download Connector/J and copy the `mysql-connector-java-5.0.4-bin.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBOSS_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
    "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

26.5.2.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

26.5.2.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqldResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your `CLASSPATH`.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
 - JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.

- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

26.5.2.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
 - JUnit
 - JMX
 - Connector/J
 - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysqljmx
ant dist
```

Then add `$TEMP/cmjx/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. if you have `junit`, execute the unit tests. From the command line, type:

```
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

26.5.3. Connector/MXJ Configuration

26.5.3.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the System.out. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJUrlTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";
    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = 3336;

        String url = "jdbc:mysql:mxj://localhost:" + port + "/test" + "?"
            + "serverbasedir=" + databaseDir;

        System.out.println(url);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }

        ServerLauncherSocketFactory.shutdown(databaseDir, null);
    }

    public static void printQueryResults(Connection conn, String SQLquery)
        throws Exception {
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(SQLquery);
        int columns = rs.getMetaData().getColumnCount();
        System.out.println("-----");
        System.out.println();
        while (rs.next()) {
            for (int i = 1; i <= columns; i++) {
                System.out.println(rs.getString(i));
            }
            System.out.println();
        }
        rs.close();
        stmt.close();
        System.out.println("-----");
        System.out.flush();
        Thread.sleep(100); // wait for System.out to finish flush
    }
}
```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

26.5.3.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to “start” MySQL with a `java.util.Map` of server options which you provide, as well as “shutdown”

the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;

public class ConnectorMXJObjectTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = 3336;

        MysqldResource mysqldResource = startDatabase(databaseDir, port);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String url = "jdbc:mysql://localhost:" + port + "/test";
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null) {
                    conn.close();
                }
            } catch (Exception e) {
                e.printStackTrace();
            }
            try {
                mysqldResource.shutdown();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
    }

    public static MysqldResource startDatabase(File databaseDir, int port) {
        MysqldResource mysqldResource = new MysqldResource(databaseDir);

        Map database_options = new HashMap();
        database_options.put("port", Integer.toString(port));
        mysqldResource.start("test-mysqld-thread", database_options);

        if (!mysqldResource.isRunning()) {
            throw new RuntimeException("MySQL did not start.");
        }

        System.out.println("MySQL is running.");

        return mysqldResource;
    }

    public static void printQueryResults(Connection conn, String SQLquery)
        throws Exception {
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(SQLquery);
        int columns = rs.getMetaData().getColumnCount();
        System.out.println("-----");
        System.out.println();
        while (rs.next()) {
            for (int i = 1; i <= columns; i++) {
                System.out.println(rs.getString(i));
            }
            System.out.println();
        }
        rs.close();
        stmt.close();
        System.out.println("-----");
        System.out.flush();
        Thread.sleep(100); // wait for System.out to finish flush
    }
}
```

26.5.3.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with "server.". In the following example we set two driver parameters and two server parameters:

```
String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";
```

26.5.4. Connector/MXJ Reference

26.5.4.1. MysqldResource API

26.5.4.1.1. MysqldResource Constructors

The `MysqldResource` class supports three different constructor forms:

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err, Utils util)`

The most detailed constructor, enables you to set the base directory, data directory, select a server by its version string, standard out and standard error and MySQL utilities class.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource();`

The basedir is defaulted to a subdirectory of the `java.io.tmpdir`. Output for standard out and standard err are directed to `System.out` and `System.err`;

26.5.4.1.2. MysqldResource Methods

`MysqldResource` API includes the following methods:

- `void start(String threadName, Map mysqlArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the

MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`
Shuts down the MySQL instance managed by the `MysqldResource` object.
- `Map getServerOptions();`
Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.
- `boolean isRunning();`
Returns true if the MySQL database is running.
- `boolean isReadyForConnections();`
Returns true once the database reports that is ready for connections.
- `void setKillDelay(int millis);`
The default “Kill Delay” is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a “force kill” if the database has not shutdown by itself.
- `void addCompletionListenser(Runnable listener);`
Allows for applications to be notified when the server process completes. Each “listener” will be fired off in its own thread.
- `String getVersion();`
Returns the version of MySQL.
- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`
The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

26.5.5. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

26.5.5.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `connector-mxj-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-27/
META-INF/
```

connector-mxj.properties

The MySQL version directory, [5-0-22](#) or [5-0-27](#) in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the [data](#) and [share](#) directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the [mysqld](#) for Mac OS X PowerPC is located within the [Mac_OS_X-ppc](#) directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific [mysqld](#), create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory [Mac_OS_X-i386](#).

On Unix systems, you can determine the platform using [uname](#):

```
shell> uname -p
i386
```

Now you need to download or compile [mysqld](#) for the MySQL version and platform you want to include in your custom [connector-mxj.jar](#) package into the new directory.

Create a file called [version.txt](#) in the OS/platform directory you have just created that contains the version string/path of the [mysqld](#) binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the [connector-mxj.jar](#) file with the added [mysqld](#):

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the [connector-mxj-db-files.jar](#):

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj-db-files.jar *
```

You should test this package using the steps outlined in [Section 26.5.2.3, “Connector/MXJ Quick Start Guide”](#).

Note

Because the [connector-mxj-db-files.jar](#) file is separate from the main Connector/MXJ classes you can distribute different [connector-mxj-db-files.jar](#) files to different hosts or for different projects without having to create a completely new main [connector-mxj.jar](#) file for each one.

26.5.5.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom [data_dir.jar](#) file, as included within the main [connector-mxj.jar](#) (Connector/MXJ 5.0.3 or earlier) or [connector-mxj-db-files.jar](#) (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` file, as outlined in the previous section (see [Section 26.5.5.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `connector-mxj-db-files.jar` directory, and then create an archive for `connector-mxj-db-files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

26.5.5.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will uses the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
 - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - this section *requires* the SUN reference implementation of JMX
 - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`

2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under MysqlAgent,

```
select "name=mysqlld"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the STARTMYSQLD button
8. click [Back to MBean View](#)
9. scroll to the bottom of the screen press STOPMYSQLD button
10. kill the java process running the Test Agent (jmx server)

26.5.5.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure [JAVA_HOME](#) is set (JBoss requires [JAVA_HOME](#))
 - Ensure [JAVA_HOME/bin](#) is in the [PATH](#) (You will NOT need to set your CLASSPATH, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the [connector-mxj.jar](#) to [\\$JBOSS_HOME/server/default/lib](#).
4. Deploy (copy) [mysql-connector-java-3.1.4-beta-bin.jar](#) to [\\$JBOSS_HOME/server/default/lib](#).
5. Create a [mxjtest.war](#) directory in [\\$JBOSS_HOME/server/default/deploy](#).
6. Deploy (copy) [index.jsp](#) to [\\$JBOSS_HOME/server/default/deploy/mxjtest.war](#).
7. Create a [mysqlld-service.xml](#) file in [\\$JBOSS_HOME/server/default/deploy](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqlldDynamicMBean"
    name="mysql:type=service,name=mysqlld">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
</server>
```

8. Start jboss:
 - on unix: [\\$JBOSS_HOME/bin/run.sh](#)

- on windows: `%JBoss_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.

9. When JBoss seems to have stopped sending output to the screen, open a web browser to: <http://localhost:8080/jmx-console>
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysql` link.
11. Observe the JMX MBean View page. MySQL should already be running.
12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to <http://localhost:8080/mxjtest/> and you should see that

```
SELECT 1
```

returned with a result of

```
1
```
14. Guided by the `$JBoss_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

26.5.6. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 26.5.6.1, "Connector/MXJ Community Support"](#).

26.5.6.1. Connector/MXJ Community Support

MySQL AB provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, "MySQL Mailing Lists"](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, "MySQL Community Support at the MySQL Forums"](#).

26.5.6.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 26.5.6.1, "Connector/MXJ Community Support"](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version

- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

26.5.6.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.6, “MySQL Connector/MXJ Change History”](#).

26.6. Connector/PHP

The PHP distribution and documentation are available from the PHP Web site. MySQL provides the `mysql` and `mysqli` extensions for the Windows operating system on <http://dev.mysql.com/downloads/connector/php/> for MySQL version 4.1.16 and higher, MySQL 5.0.18, and MySQL 5.1. You can find information why you should preferably use the extensions provided by MySQL on that page. For platforms other than Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See [Section 25.3, “MySQL PHP API”](#).

Chapter 27. MySQL Proxy

The MySQL Proxy is an application that communicates over the network using the MySQL Network Protocol and provides communication between one or more MySQL servers and one or more MySQL clients. In the most basic configuration, MySQL Proxy simply passes on queries from the client to the MySQL Server and returns the responses from the MySQL Server to the client.

Because MySQL Proxy uses the MySQL network protocol, any MySQL compatible client (include the command line client, any clients using the MySQL client libraries, and any connector that supports the MySQL network protocol) can connect to the proxy without modification.

In addition to the basic pass-through configuration, the MySQL Proxy is also capable of monitoring and altering the communication between the client and the server. This interception of the queries enables you to add profiling. The interception of the exchanges is scriptable using the Lua scripting language.

By intercepting the queries from the client, the proxy can insert additional queries into the list of queries sent to the server, and remove the additional results when they are returned by the server. Using this functionality you can add informational statements to each query, for example to monitor their execution time or progress, and separately log the results, while still returning the results from the original query to the client.

The proxy allows you to perform additional monitoring, filtering or manipulation on queries without you having to make any modifications to the client and without the client even being aware that it is communicating with anything but a genuine MySQL server.

Warning

MySQL Proxy is currently an Alpha release and should not be used within production environments.

Important

MySQL Proxy is compatible with MySQL 5.0.x or later. Testing has not been performed with Version 4.1. Please provide feedback on your experiences via the [MySQL Proxy Forum](#).

27.1. MySQL Proxy Supported Platforms

MySQL Proxy is currently available as a pre-compiled binary for the following platforms:

- Linux (including RedHat, Fedora, Debian, SuSE) and derivatives.
- Mac OS X
- FreeBSD
- IBM AIX
- Sun Solaris

Other Unix/Linux platforms not listed should be compatible by using the source package and building MySQL Proxy locally.

System requirements for the MySQL Proxy application are the same as the main MySQL server. Currently MySQL Proxy is compatible only with MySQL 5.0.1 and later. MySQL Proxy is provided as a standalone, statically linked binary. You do not need to have MySQL or Lua installed.

27.2. Installing MySQL Proxy

You have three choices for installing MySQL Proxy:

- Pre-compiled binaries are available for a number of different platforms. See [Section 27.2.1, “Installing MySQL Proxy from a binary distribution”](#).
- You can install from the source code if you want to build on an environment not supported by the binary distributions. See [Section 27.2.2, “Installing MySQL Proxy from a source distribution”](#).

- The latest version of the MySQL proxy source code is available through a development repository is the best way to stay up to date with the latest fixes and revisions. See [Section 27.2.3, “Installing MySQL Proxy from the Subversion repository”](#).

27.2.1. Installing MySQL Proxy from a binary distribution

If you download the binary packages then you need only to extract the package and then copy the `mysql-proxy` file to your desired location. For example:

```
$ tar xzf mysql-proxy-0.5.0.tar.gz
$ cp ./mysql-proxy-0.5.0/sbin/mysql-proxy /usr/local/sbin
```

27.2.2. Installing MySQL Proxy from a source distribution

If you have downloaded the source package then you will need to compile the MySQL Proxy before using it. To build you will need to have the following installed:

- libevent 1.x or higher (1.3b or later is preferred)
- lua 5.1.x or higher
- glib2 2.6.0 or higher
- pkg-config
- MySQL 5.0.x or higher developer files

Once these components are installed, you need to configure and then build:

```
$ tar xzf mysql-proxy-0.5.0.tar.gz
$ cd mysql-proxy-0.5.0
$ ./configure
$ make
```

If you want to test the build, then use the `check` target to `make`:

```
$ make check
```

The tests try to connect to `localhost` using the `root` user. If you need to provide a password, set the `MYSQL_PASSWORD` environment variable:

```
$ MYSQL_PASSWORD=root_pwd make check
```

You can install using the `install` target:

```
$ make install
```

By default `mysql-proxy` is installed into `/usr/local/sbin/mysql-proxy`. The Lua example scripts are copied into `/usr/local/share`.

27.2.3. Installing MySQL Proxy from the Subversion repository

The MySQL Proxy source is available through a public Subversion repository and is the quickest way to get hold of the latest releases and fixes.

To build from the Subversion repository, you need the following components already installed:

- Subversion 1.3.0 or higher
- `libtool` 1.5 or higher

- [autoconf](#) 2.56 or higher
- [automake](#) 1.9 or higher
- [libevent](#) 1.x or higher (1.3b or later is preferred)
- [lua](#) 5.1.x or higher
- [glib2](#) 2.4.0 or higher
- [pkg-config](#)
- [MySQL](#) 5.0.x or higher developer files

To checkout a local copy of the Subversion repository, use [svn](#):

```
$ svn co http://svn.MySQL.com/svnpublic/mysql-proxy/ mysql-proxy
```

The above command will download a complete version of the Subversion repository for [mysql-proxy](#). The main source files are located within the [trunk](#) subdirectory. The configuration scripts need to be generated before you can configure and build [mysql-proxy](#). The [autogen.sh](#) script will generate the configuration scripts for you:

```
$ sh ./autogen.sh
```

The script creates the standard [configure](#) script, which you can then use to configure and build with [make](#):

```
$ ./configure
$ make
$ make install
```

If you want to create a standalone source distribution, identical to the source distribution available for download:

```
$ make distcheck
```

The above will create the file [mysql-proxy-0.5.0.tar.gz](#) within the current directory.

27.3. MySQL Proxy Command Line Options

To start [mysql-proxy](#) you can just run the command directly. However, for most situations you will want to specify at the very least the address/hostname and port number of the backend MySQL server to which the MySQL Proxy should pass on queries.

You can get a list of the supported command-line options using the [--help-all](#) command line option. The majority of these options set up the environment, either in terms of the address/port number that [mysql-proxy](#) should listen on for connections, or the onward connection to a MySQL server. A full description of the options is shown below:

- [--help-all](#) — show all help options.
- [--help-admin](#) — show options for the admin-module.
- [--help-proxy](#) — Show options for the proxy-module.
- [--admin-address=host:port](#) — specify the hostname (or IP address) and port for the administration port. The default is [localhost:4041](#).
- [--proxy-address=host:port](#) — the listening hostname (or IP address) and port of the proxy server. The default is [localhost:4040](#).
- [--proxy-read-only-address=host:port](#) — the listening hostname (or IP address) and port of the proxy server for read-only connections. The default is [localhost:4042](#).
- [--proxy-backend-addresses=host:port](#) — the hostname (or IP address) and port of the MySQL server to connect to. You can specify multiple backend servers by supplying multiple options. Clients are connected to each backend server in round-

robin fashion. For example, if you specify two servers A and B, the first client connection will go to server A; the second client connection to server B and the third client connection to server A.

- `--proxy-skip-profiling` — disables profiling of queries (tracking time statistics). The default is for tracking to be enabled.
- `--proxy-fix-bug-25371` — gets round an issue when connecting to a MySQL server later than 5.1.12 when using a MySQL client library of any earlier version.
- `--proxy-lua-script=file` — specify the Lua script file to be loaded. Note that the script file is not physically loaded and parsed until a connection is made. Also note that the specified Lua script is reloaded for each connection; if the content of the Lua script changes while `mysql-proxy` is running then the updated content will automatically be used when a new connection is made.
- `--daemon` — starts the proxy in daemon mode.
- `--pid-file=file` — sets the name of the file to be used to store the process ID.
- `--version` — show the version number.

The most common usage is as a simple proxy service (i.e. without addition scripting). For basic proxy operation you must specify at least one `proxy-backend-addresses` option to specify the MySQL server to connect to by default:

```
$ mysql-proxy
--proxy-backend-addresses=MySQL.example.com:3306
```

The default proxy port is `4040`, so you can connect to your MySQL server through the proxy by specifying the hostname and port details:

```
$ mysql --host=localhost --port=4040
```

If your server requires authentication information then this will be passed through natively without alteration by `mysql-proxy`, so you must also specify the authentication information if required:

```
$ mysql --host=localhost --port=4040 \
--user=username --password=password
```

You can also connect to a read-only port (which filters out `UPDATE` and `INSERT` queries) by connecting to the read-only port. By default the hostname is the default, and the port is `4042`, but you can alter the host/port information by using the `--proxy-read-only-address` command line option.

For more detailed information on how to use these command line options, and `mysql-proxy` in general in combination with Lua scripts, see [Section 27.5, “Using MySQL Proxy”](#).

27.4. MySQL Proxy Scripting

You can control how MySQL Proxy manipulates and works with the queries and results that are passed on to the MySQL server through the use of the embedded Lua scripting language. You can find out more about the Lua programming language from the [Lua Website](#).

The primary interaction between MySQL Proxy and the server is provided by defining one or more functions through an Lua script. A number of functions are supported, according to different events and operations in the communication sequence between a client and one or more backend MySQL servers:

- `connect_server()` — this function is called each time a connection is made to MySQL Proxy from a client. You can use this function during load-balancing to intercept the original connection and decide which server the client should ultimately be attached to. If you don't define a special solution, then a simple round-robin style distribution is used by default.
- `read_handshake()` — this function is called when the initial handshake information is returned by the server. You can capture the handshake information returned and provide additional checks before the authorization exchange takes place.
- `read_auth()` — this function is called when the authorization packet (username, password, default database) are submitted by the client to the server for authentication.

- `read_auth_result()` — this function is called when the server returns an authorization packet to the client indicating whether the authorization succeeded.
- `read_query()` — this function is called each time a query is sent by the client to the server. You can use this to edit and manipulate the original query, including adding new queries before and after the original statement. You can also use this function to return information directly to the client, bypassing the server, which can be useful to filter unwanted queries or queries that exceed known limits.
- `read_query_result()` — this function is called each time a result is returned from the server, providing you have manually injected queries into the query queue. If you have not explicitly inject queries within the `read_query()` function then this function is not triggered. You can use this to edit the result set, or to remove or filter the result sets generated from additional queries you injected into the queue when using `read_query()`.

The table below describes the direction of flow of information at the point when the function is triggered.

Function	Supplied Information	Direction
<code>connect_server()</code>	None	Client to Server
<code>read_handshake()</code>	Handshake packet	Server to Client
<code>read_auth()</code>	Authorization packet	Client to Server
<code>read_auth_result()</code>	Authorization response	Server to Client
<code>read_query()</code>	Query	Client to Server
<code>read_query_result()</code>	Query result	Server to Client

By default, all functions return a result that indicates that the data should be passed on to the client or server (depending on the direction of the information being transferred). This return value can be overridden by explicitly returning a constant indicating that a particular response should be sent. For example, it is possible to construct result set information by hand within `read_query()` and to return the resultset directly to the client without ever sending the original query to the server.

In addition to these functions, a number of built-in structures provide control over how MySQL Proxy forwards on queries and returns the results by providing a simplified interface to elements such as the list of queries and the groups of result sets that are returned.

27.4.1. Proxy Scripting Sequence During Query Injection

The figure below gives an example of how the proxy might be used when injecting queries into the query queue. Because the proxy sits between the client and MySQL server, what the proxy sends to the server, and the information that the proxy ultimately returns to the client do not have to match correlate. Once the client has connected to the proxy, the following sequence occurs for each individual query sent by the client.

1. The client submits one query to the proxy, the `read_query()` function within the proxy is triggered. The function adds the query to the query queue.
2. Once manipulation by `read_query()` has completed, the queries are submitted, sequentially, to the MySQL server.
3. The MySQL server returns the results from each query, one result set for each query submitted. The `read_query_result()` function is triggered for each result set, and each invocation can decide which result set to return to the client

For example, you can queue additional queries into the global query queue to be processed by the server. This can be used to add statistical information by adding queries before and after the original query, changing the original query:

```
SELECT * FROM City;
```

Into a sequence of queries:

```
SELECT NOW();
SELECT * FROM City;
SELECT NOW();
```

You can also modify the original statement, for example to add `EXPLAIN` to each statement executed to get information on how the statement was processed, again altering our original SQL statement into a number of statements:

```
SELECT * FROM City;
EXPLAIN SELECT * FROM City;
```

In both of these examples, the client would have received more result sets than expected. Regardless of how you manipulate the incoming query and the returned result, the number of queries returned by the proxy must match the number of original queries sent by the client.

You could adjust the client to handle the multiple result sets sent by the proxy, but in most cases you will want the existence of the proxy to remain transparent. To ensure that the number of queries and result sets match, you can use the MySQL Proxy `read_query_result()` to extract the additional result set information and return only the result set the client originally requested back to the client. You can achieve this by giving each query that you add to the query queue a unique ID, and then filter out queries that do not match the original query ID when processing them with `read_query_result()`.

27.4.2. Internal Structures

There are a number of internal structures within the scripting element of MySQL Proxy. The primary structure is `proxy` and this provides an interface to the many common structures used throughout the script, such as connection lists and configured backend servers. Other structures, such as the incoming packet from the client and result sets are only available within the context of one of the scriptable functions.

Attribute	Description
<code>connection</code>	A structure containing the active client connections. For a list of attributes, see <code>proxy.connection</code> .
<code>servers</code>	A structure containing the list of configured backend servers. For a list of attributes, see <code>proxy.servers</code> .
<code>queries</code>	A structure containing the queue of queries that will be sent to the server during a single client query. For a list of attributes, see <code>proxy.queries</code> .
<code>PROXY_VERSION</code>	The version number of MySQL Proxy, encoded in hex. You can use this to check that the version number supports a particular option from within the Lua script. Note that the value is encoded as a hex value, so to check the version is at least 0.5.1 you compare against <code>0x00501</code> .

`proxy.connection`

The `proxy.connection` object is read only, and provides information about the current connection.

Attribute	Description
<code>thread_id</code>	The thread ID of the connection.
<code>backend_ndx</code>	The ID of the server used for this connection. This is an ID valid against the list of configured servers available through the <code>proxy.servers</code> object.

`proxy.servers`

The `proxy.servers` table is partially writable and contains an array of all the configured backend servers and the server metadata (IP address, status, etc.). You can determine the array index of the current connection using `proxy.connection["backend_ndx"]` which is the index into this table of the backend server being used by the active connection.

The attributes for each entry within the `proxy.servers` table is shown in this table.

Attribute	Description
<code>address</code>	The hostname/port combination used for this connection
<code>connected_clients</code>	The number of clients currently connected.
<code>state</code>	The status of the backend server. See Section 27.4.2, “Internal Structures” [1694]

`proxy.queries`

The `proxy.queries` object is a queue representing the list of queries to be sent to the server. The queue is not populated automatically, but if you do not explicitly populate the queue then queries are passed on to the backend server verbatim. Also, if you do not populate the query queue by hand, then the `read_query_result()` function is not triggered.

The following methods are supported for populating the `proxy.queries` object.

Function	Description
<code>append(id, packet)</code>	Appends a query to the end of the query queue. The <code>id</code> is an integer identifier that you can use to recognize the query results when they are returned by the server. The packet should be a properly formatted query packet.
<code>prepend(id, packet)</code>	Prepends a query to the query queue. The <code>id</code> is an identifier that you can use to recognize the query results when they are returned by the server. The packet should be a properly formatted query packet.

Function	Description
<code>reset()</code>	Empties the query queue.
<code>len()</code>	Returns the number of query packets in the queue.

For example, you could append a query packet to the `proxy.queries` queue by using the `append()`:

```
proxy.queries:append(1, packet)
```

Proxy Return State Constants

The following constants are used internally by the proxy to specify the response to send to the client or server. All constants are exposed as values within the main `proxy` table.

Constant	Description
<code>PROXY_SEND_QUERY</code>	Causes the proxy to send the current contents of the queries queue to the server.
<code>PROXY_SEND_RESULT</code>	Causes the proxy to send a result set back to the client.
<code>PROXY_IGNORE_RESULT</code>	Causes the proxy to drop the result set (nothing is returned to the client).

As constants, these entities are available without qualification in the Lua scripts. For example, at the end of the `read_query_result()` you might return `PROXY_IGNORE_RESULT`:

```
return proxy.PROXY_IGNORE_RESULT
```

Packet State Constants

The following states describe the status of a network packet. These items are entries within the main `proxy` table.

Constant	Description
<code>MYSQLD_PACKET_OK</code>	The packet is OK.
<code>MYSQLD_PACKET_ERR</code>	The packet contains error information.
<code>MYSQLD_PACKET_RAW</code>	The packet contains raw data.

Backend State/Type Constants

The following constants are used either to define the status of the backend server (the MySQL server to which the proxy is connected) or the type of backend server. These items are entries within the main `proxy` table.

Constant	Description
<code>BACKEND_STATE_UNKNOWN</code>	The current status is unknown.
<code>BACKEND_STATE_UP</code>	The backend is known to be up (available).
<code>BACKEND_STATE_DOWN</code>	The backend is known to be down (unavailable).
<code>BACKEND_TYPE_UNKNOWN</code>	Backend type is unknown.
<code>BACKEND_TYPE_RW</code>	Backend is available for read/write.
<code>BACKEND_TYPE_RO</code>	Backend is available only for read-only use.

Server Command Constants

The following values are used in the packets exchanged between the client and server to identify the information in the rest of the packet. These items are entries within the main `proxy` table. The packet type is defined as the first character in the sent packet. For example, when intercepting packets from the client to edit or monitor a query you would check that the first byte of the packet was of type `proxy.COM_QUERY`.

Constant	Description
COM_SLEEP	Sleep
COM_QUIT	Quit
COM_INIT_DB	Initialize database
COM_QUERY	Query
COM_FIELD_LIST	Field List
COM_CREATE_DB	Create database
COM_DROP_DB	Drop database
COM_REFRESH	Refresh
COM_SHUTDOWN	Shutdown
COM_STATISTICS	Statistics
COM_PROCESS_INFO	Process List
COM_CONNECT	Connect
COM_PROCESS_KILL	Kill
COM_DEBUG	Debug
COM_PING	Ping
COM_TIME	Time
COM_DELAYED_INSERT	Delayed insert
COM_CHANGE_USER	Change user
COM_BINLOG_DUMP	Binlog dump
COM_TABLE_DUMP	Table dump
COM_CONNECT_OUT	Connect out
COM_REGISTER_SLAVE	Register slave
COM_STMT_PREPARE	Prepare server-side statement
COM_STMT_EXECUTE	Execute server-side statement
COM_STMT_SEND_LONG_DATA	Long data
COM_STMT_CLOSE	Close server-side statement
COM_STMT_RESET	Reset statement
COM_SET_OPTION	Set option
COM_STMT_FETCH	Fetch statement
COM_DAEMON	Daemon (MySQL 5.1 only)
COM_ERROR	Error

MySQL Type Constants

These constants are used to identify the field types in the query result data returned to clients from the result of a query. These items are entries within the main [proxy](#) table.

Constant	Field Type
MYSQL_TYPE_DECIMAL	Decimal
MYSQL_TYPE_NEWDECIMAL	Decimal (MySQL 5.0 or later)
MYSQL_TYPE_TINY	Tiny
MYSQL_TYPE_SHORT	Short
MYSQL_TYPE_LONG	Long
MYSQL_TYPE_FLOAT	Float
MYSQL_TYPE_DOUBLE	Double

Constant	Field Type
<code>MYSQL_TYPE_NULL</code>	Null
<code>MYSQL_TYPE_TIMESTAMP</code>	Timestamp
<code>MYSQL_TYPE_LONGLONG</code>	Long long
<code>MYSQL_TYPE_INT24</code>	Integer
<code>MYSQL_TYPE_DATE</code>	Date
<code>MYSQL_TYPE_TIME</code>	Time
<code>MYSQL_TYPE_DATETIME</code>	Datetime
<code>MYSQL_TYPE_YEAR</code>	Year
<code>MYSQL_TYPE_NEWDATE</code>	Date (MySQL 5.0 or later)
<code>MYSQL_TYPE_ENUM</code>	Enumeration
<code>MYSQL_TYPE_SET</code>	Set
<code>MYSQL_TYPE_TINY_BLOB</code>	Tiny Blob
<code>MYSQL_TYPE_MEDIUM_BLOB</code>	Medium Blob
<code>MYSQL_TYPE_LONG_BLOB</code>	Long Blob
<code>MYSQL_TYPE_BLOB</code>	Blob
<code>MYSQL_TYPE_VAR_STRING</code>	Varstring
<code>MYSQL_TYPE_STRING</code>	String
<code>MYSQL_TYPE_TINY</code>	Tiny (compatible with <code>MYSQL_TYPE_CHAR</code>)
<code>MYSQL_TYPE_ENUM</code>	Enumeration (compatible with <code>MYSQL_TYPE_INTERVAL</code>)
<code>MYSQL_TYPE_GEOMETRY</code>	Geometry
<code>MYSQL_TYPE_BIT</code>	Bit

27.4.3. Capturing a connection with `connect_server()`

When the proxy accepts a connection from a MySQL client, the `connect_server()` function is called.

There are no arguments to the function, but you can use and if necessary manipulate the information in the `proxy.connection` table, which is unique to each client session.

For example, if you have multiple backend servers then you can set the server to be used by that connection by setting the value of `proxy.connection.backend_ndx` to a valid server number. The code below will choose between two servers based on whether the current time in minutes is odd or even:

```
function connect_server()
    print("--> a client really wants to talk to a server")
    if (tonumber(os.date("%M")) % 2 == 0) then
        proxy.connection.backend_ndx = 2
        print("Choosing backend 2")
    else
        proxy.connection.backend_ndx = 1
        print("Choosing backend 1")
    end
    print("Using " .. proxy.servers[proxy.connection.backend_ndx].address)
end
```

In this example the IP address/port combination is also displayed by accessing the information from the internal `proxy.servers` table.

27.4.4. Examining the handshake with `read_handshake()`

Handshake information is sent by the server to the client after the initial connection (through `connect_server()`) has been made. The handshake information contains details about the MySQL version, the ID of the thread that will handle the connection information, and the IP address of the client and server. This information is exposed through a Lua table as the only argument to the function.

- `mysqlnd_version` — the version of the MySQL server.
- `thread_id` — the thread ID.
- `scramble` — the password scramble buffer.
- `server_addr` — the IP address of the server.
- `client_addr` — the IP address of the client.

For example, you can print out the handshake data and refuse clients by IP address with the following function:

```
function read_handshake( auth )
    print("<-- let's send him some information about us")
    print("    mysqlnd-version: " .. auth.mysqlnd_version)
    print("    thread-id       : " .. auth.thread_id)
    print("    scramble-buf    : " .. string.format("%q", auth.scramble))
    print("    server-addr     : " .. auth.server_addr)
    print("    client-addr      : " .. auth.client_addr)

    if not auth.client_addr:match("^127.0.0.1:") then
        proxy.response.type = proxy.MYSQLD_PACKET_ERR
        proxy.response.errmsg = "only local connects are allowed"

        print("we don't like this client");

        return proxy.PROXY_SEND_RESULT
    end
end
```

Note that you have to return an error packet to the client by using `proxy.PROXY_SEND_RESULT`.

27.4.5. Examining the authentication credentials with `read_auth()`

The `read_auth()` function is triggered when an authentication handshake is initiated by the client. In the execution sequence, `read_auth()` occurs immediately after `read_handshake()`, so the server selection has already been made, but the connection and authorization information has not yet been provided to the backend server.

The function accepts a single argument, an Lua table containing the authorization information for the handshake process. The entries in the table are:

- `username` — the user login for connecting to the server.
- `password` — the password, encrypted, to be used when connecting.
- `default_db` — the default database to be used once the connection has been made.

For example, you can print the username and password supplied during authorization using:

```
function read_auth( auth )
    print("    username      : " .. auth.username)
    print("    password      : " .. string.format("%q", auth.password))
end
```

You can interrupt the authentication process within this function and return an error packet back to the client by constructing a new packet and returning `proxy.PROXY_SEND_RESULT`:

```
proxy.response.type = proxy.MYSQLD_PACKET_ERR
proxy.response.errmsg = "Logins are not allowed"
return proxy.PROXY_SEND_RESULT
```

27.4.6. Accessing authentication information with `read_auth_result()`

The return packet from the server during authentication is captured by `read_auth_result()`. The only argument to this function is the authentication packet returned by the server. As the packet is a raw MySQL network protocol packet, you must access the first byte to identify the packet type and contents. The `MYSQLD_PACKET_ERR` and `MYSQLD_PACKET_OK` constants can be used to identify

whether the authentication was successful:

```
function read_auth_result( auth )
    local state = auth.packet:byte()

    if state == proxy.MYSQLD_PACKET_OK then
        print("<-- auth ok");
    elseif state == proxy.MYSQLD_PACKET_ERR then
        print("<-- auth failed");
    else
        print("<-- auth ... don't know: " .. string.format("%q", auth.packet));
    end
end
```

27.4.7. Manipulating Queries with `read_query()`

The `read_query()` function is called once for each query submitted by the client and accepts a single argument, the query packet that was provided. To access the content of the packet you must parse the packet contents manually.

For example, you can intercept a query packet and print out the contents using the following function definition:

```
function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        print("we got a normal query: " .. packet:sub(2))
    end
end
```

This example checks the first byte of the packet to determine the type. If the type is `COM_QUERY` (see [Section 27.4.2, “Internal Structures” \[1694\]](#)), then we extract the query from the packet and print it out. The structure of the packet type supplied is important. In the case of a `COM_QUERY` packet, the remaining contents of the packet are the text of the query string. In this example, no changes have been made to the query or the list of queries that will ultimately be sent to the MySQL server.

To modify a query, or add new queries, you must populate the query queue (`proxy.queries`) and then execute the queries that you have placed into the queue. If you do not modify the original query or the queue, then the query received from the client is sent to the MySQL server verbatim.

When adding queries to the queue, you should follow these guidelines:

- The packets inserted into the queue must be valid query packets. For each packet, you must set the initial byte to the packet type. If you are appending a query, you can append the query statement to the rest of the packet.
- Once you add a query to the queue, the queue is used as the source for queries sent to the server. If you add a query to the queue to add more information, you must also add the original query to the queue or it will not be executed.
- Once the queue has been populated, you must set the return value from `read_query()` to indicate whether the query queue should be sent to the server.
- When you add queries to the queue, you should add an ID. The ID you specify is returned with the result set so that you identify each query and corresponding result set. The ID has no other purpose than as an identifier for correlating the query and resultset. When operating in a passive mode, during profiling for example, you want to identify the original query and the corresponding resultset so that the results expect by the client can be returned correctly.
- Unless your client is designed to cope with more result sets than queries, you should ensure that the number of queries from the client match the number of results sets returned to the client. Using the unique ID and removing result sets you inserted will help.

Normally, the `read_query()` and `read_query_result()` function are used in conjunction with each other to inject additional queries and remove the additional result sets. However, `read_query_result()` is only called if you populate the query queue within `read_query()`.

27.4.8. Manipulating Results with `read_query_result()`

The `read_query_result()` is called for each result set returned by the server only if you have manually injected queries into the query queue. If you have not manipulated the query queue then this function is not called. The function supports a single argument, the result packet, which provides a number of properties:

- `id` — the ID of the result set, which corresponds to the ID that was set when the query packet was submitted to the server when us-

ing `append(id)` on the query queue.

- `query` — the text of the original query.
- `query_time` — the number of microseconds required to receive the first row of a result set.
- `response_time` — the number of microseconds required to receive the last row of the result set.
- `resultset` — the content of the result set data.

By accessing the result information from the MySQL server you can extract the results that match the queries that you injected, return different result sets (for example, from a modified query), and even create your own result sets.

The Lua script below, for example, will output the query, followed by the query time and response time (i.e. the time to execute the query and the time to return the data for the query) for each query sent to the server:

```
function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        print("we got a normal query: " .. packet:sub(2))

        proxy.queries:append(1, packet )

        return proxy.PROXY_SEND_QUERY
    end
end

function read_query_result(inj)
    print("query-time: " .. (inj.query_time / 1000) .. "ms")
    print("response-time: " .. (inj.response_time / 1000) .. "ms")
end
```

You can access the rows of returned results from the resultset by accessing the rows property of the resultset property of the result that is exposed through `read_query_result()`. For example, you can iterate over the results showing the first column from each row using this Lua fragment:

```
for row in inj.resultset.rows do
    print("injected query returned: " .. row[0])
end
```

Just like `read_query()`, `read_query_result()` can return different values for each result according to the result returned. If you have injected additional queries into the query queue, for example, then you will want to remove the results returned from those additional queries and only return the results from the query originally submitted by the client.

The example below injects additional `SELECT NOW()` statements into the query queue, given them a different ID to the ID of the original query. Within `read_query_result()`, if the ID for the injected queries is identified, we display the result row, and return the `proxy.PROXY_IGNORE_RESULT` from the function so that the result is not returned to the client. If the result is from any other query, we print out the query time information for the query and return the default, which passes on the result set unchanged. We could also have explicitly returned `proxy.PROXY_IGNORE_RESULT` to the MySQL client.

```
function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        proxy.queries:append(2, string.char(proxy.COM_QUERY) .. "SELECT NOW()" )
        proxy.queries:append(1, packet )
        proxy.queries:append(2, string.char(proxy.COM_QUERY) .. "SELECT NOW()" )

        return proxy.PROXY_SEND_QUERY
    end
end

function read_query_result(inj)
    if inj.id == 2 then
        for row in inj.resultset.rows do
            print("injected query returned: " .. row[0])
        end
        return proxy.PROXY_IGNORE_RESULT
    else
        print("query-time: " .. (inj.query_time / 1000) .. "ms")
        print("response-time: " .. (inj.response_time / 1000) .. "ms")
    end
end
```

For further examples, see [Section 27.5, “Using MySQL Proxy”](#).

27.5. Using MySQL Proxy

There are a number of different ways to use MySQL Proxy. At the most basic level, you can allow MySQL Proxy to pass on queries from clients to a single server. To use MySQL proxy in this mode, you just have to specify the backend server that the proxy should connect to on the command line:

```
$ mysql-proxy --proxy-backend-addresses=sakila:3306
```

If you specify multiple backend MySQL servers then the proxy will connect each client to each server in a round-robin fashion. For example, imagine you have two MySQL servers, A and B. The first client to connect will be connected to server A, the second to server B, the third to server C. For example:

```
$ mysql-proxy \
  --proxy-backend-addresses=narcissus:3306 \
  --proxy-backend-addresses=nostromo:3306
```

When you have specified multiple servers in this way, the proxy will automatically identify when a MySQL server has become unavailable and mark it accordingly. New connections will automatically be attached to a server that is available, and a warning will be reported to the standard output from [mysql-proxy](#):

```
network-mysqld.c.367: connect(nostromo:3306) failed: Connection refused
network-mysqld-proxy.c.2405: connecting to backend (nostromo:3306) failed, marking it as down for ...
```

Lua scripts enable a finer level of control, both over the connections and their distribution and how queries and result sets are processed. When using an Lua script, you must specify the name of the script on the command line using the [--proxy-lua-script](#) option:

```
$ mysql-proxy --proxy-lua-script=mc.lua --proxy-backend-addresses=sakila:3306
```

When you specify a script, the script is not executed until a connection is made. This means that faults with the script will not be raised until the script is executed. Script faults will not affect the distribution of queries to backend MySQL servers.

Note

Because the script is not read until the connection is made, you can modify the contents of the Lua script file while the proxy is still running and the script will automatically be used for the next connection. This ensures that MySQL Proxy remains available because it does not have to be restarted for the changes to take effect.

27.5.1. Using the Administration Interface

The [mysql-proxy](#) administration interface can be accessed using any MySQL client using the standard protocols. You can use the administration interface to gain information about the proxy server as a whole - standard connections to the proxy are isolated to operate as if you were connected directly to the backend MySQL server. Currently, the interface supports a limited set of functionality designed to provide connection and configuration information.

Because connectivity is provided over the standard MySQL protocol, you must access this information using SQL syntax. By default, the administration port is configured as 4041. You can change this port number using the [--admin-address](#) command line option.

To get a list of the currently active connections to the proxy:

```
mysql> select * from proxy_connections;
+----+-----+-----+-----+
| id | type  | state | db   |
+----+-----+-----+-----+
| 0  | server | 0     |      |
| 1  | proxy  | 0     |      |
| 2  | server | 10    |      |
+----+-----+-----+-----+
3 rows in set (0.00 sec)
```

To get the current configuration:

```
mysql> select * from proxy_config;
+-----+-----+
| option | value |
+-----+-----+
| admin.address | :4041 |
| proxy.address | :4040 |
| proxy.lua_script | mc.lua |
+-----+-----+
```

proxy.backend_addresses[0]	mysql:3306	
proxy.fix_bug_25371	0	
proxy.profiling	1	
+-----+-----+		

6 rows in set (0.01 sec)

Chapter 28. Extending MySQL

28.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.9.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our [internals](#) mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.7.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the [internals](#) list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

28.1.1. MySQL Threads

The MySQL server creates the following threads:

- One thread manages TCP/IP file connection requests and creates a new dedicated thread to handle the authentication and SQL statement processing for each connection. (On Unix, this thread also manages Unix socket file connection requests.) On Windows, a similar thread manages shared-memory connection requests, and a thread manages named-pipe connection requests. Every client connection has its own thread, although the manager threads try to avoid creating threads by consulting the thread cache first to see whether a cached thread can be used for a new connection.
- On a master replication server, slave server connections are like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- The signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If **InnoDB** is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See [Section 13.5.4, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which **INSERT DELAYED** statements are issued gets its own thread.
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running.

`mysqladmin processlist` only shows the connection, **INSERT DELAYED**, replication threads, and event threads.

MySQL Enterprise

For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information see, <http://www.mysql.com/products/enterprise/advisors.html>.

28.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make`

`test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.8, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

You can use the `mysqltest` language to write your own test cases. This is documented in the MySQL Test Framework manual, available at <http://dev.mysql.com/doc/>.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

28.2. The MySQL Plugin Interface

MySQL 5.1 and up supports a plugin API that allows the loading and unloading of server components at runtime, without restarting the server. Currently, the plugin API supports creation of full-text parser plugins. Such a plugin can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface. The plugin interface eventually will include an API for creating UDFs, and it is intended this plugin UDF API will replace the older non-plugin UDF API. After that point, it will be possible for UDFs to be revised for use as plugin UDFs so that they can take advantage of the better security and versioning capabilities of the plugin API. Eventually, support for the older UDF API will be phased out.

The plugin interface requires the `plugin` table in the `mysql` database. This table is created as part of the MySQL installation process. If you are upgrading from an older version to MySQL 5.1, you should run the `mysql_upgrade` command to create this table. See [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

28.2.1. Characteristics of the Plugin Interface

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface:

- The plugin framework is extendable to accommodate different kinds of plugins.

Some aspects of the plugin API are common to all types of plugins, but the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Although only the interface for full-text parser plugins is implemented currently, others can be added, such as an interface for UDF plugins.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- Plugin security is improved relative to the UDF interface.

The older interface for writing non-plugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively non-specific. The newer rules are more strict. A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

The newer plugin interface eliminates the security issues of the older UDF interface. When a UDF plugin type is implemented, that will allow non-plugin UDFs to be brought into the plugin framework and the older interface to be phased out.

The plugin implementation includes the following components:

Source files (the locations given indicate where the files are found in a MySQL source distribution):

- `include/mysql/plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library.
- `sql/sql_plugin.h` and `sql/sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin writers. They may be of interest for those who want to know more about how the server handles plugins.

System table:

- The `plugin` table in the `mysql` database lists each installed plugin and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version older than MySQL 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#)).

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about known plugins. The `PLUGINS` table in `INFORMATION_SCHEMA` also contains plugin information.

System variable:

- `plugin_dir` indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option.

28.2.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 11.8, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_XXX` system variables and the stopwords list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-plaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

28.2.3. INSTALL PLUGIN Syntax

```
INSTALL PLUGIN plugin_name SONAME 'plugin_library'
```

This statement installs a plugin.

plugin_name is the name of the plugin as defined in the plugin declaration structure contained in the library file. Plugin name case sensitivity is determined by the host system filename semantics.

plugin_library is the name of the shared library that contains the plugin code. The name includes the filename extension (for example, `libmyplugin.so` or `libmyplugin.dylib`).

The shared library must be located in the plugin directory (that is, the directory named by the `plugin_dir` system variable). The library must be in the plugin directory itself, not in a subdirectory. By default, `plugin_dir` is the directory named by the `pkglibdir` configuration variable, but it can be changed by setting the value of `plugin_dir` at server startup. For example, set its value in a `my.cnf` file:

```
[mysqld]
plugin_dir=/path/to/plugin/directory
```

If the value of `plugin_dir` is a relative pathname, it is taken to be relative to the MySQL base directory (the value of the `basedir` system variable).

INSTALL PLUGIN adds a line to the `mysql.plugin` table that describes the `plugin`. This table contains the plugin name and library filename.

INSTALL PLUGIN also loads and initializes the plugin code to make the plugin available for use. A plugin is initialized by executing its initialization function, which handles any setup that the plugin must perform before it can be used.

To use **INSTALL PLUGIN**, you must have the **INSERT privilege** for the `mysql.plugin` table.

At server startup, the server loads and initializes any plugin that is listed in the `mysql.plugin` table. This means that a plugin is installed with **INSTALL PLUGIN** only once, not every time the server starts. Plugin loading at startup does not occur if the server is started with the `--skip-grant-tables` option.

When the server shuts down, it executes the deinitialization function for each plugin that is loaded so that the plugin has a chance to perform any final cleanup.

To remove a plugin entirely, use the **UNINSTALL PLUGIN** statement:

To see what plugins are installed, use the **SHOW PLUGIN** statement.

If you recompile a plugin library and need to reinstall it, you can use either of the following procedures:

- Use **UNINSTALL PLUGIN** to uninstall all plugins in the library, install the new plugin library file in the plugin directory, and then use **INSTALL PLUGIN** to install all plugins in the library. This procedure has the advantage that it can be used without stopping the server. However, if the plugin library contains many plugins, you must issue many **INSTALL PLUGIN** and **UNINSTALL PLUGIN** statements.
- Alternatively, stop the server, install the new plugin library file in the plugin directory, and then restart the server.

28.2.4. UNINSTALL PLUGIN Syntax

```
UNINSTALL PLUGIN plugin_name
```

This statement removes an installed plugin. You cannot uninstall a plugin if any table that uses it is open.

plugin_name must be the name of some plugin that is listed in the `mysql.plugin` table. The server executes the plugin's deinitialization function and removes the row for the plugin from the `mysql.plugin` table, so that subsequent server restarts will not load and initialize the plugin. **UNINSTALL PLUGIN** does not remove the plugin's shared library file.

To use **UNINSTALL PLUGIN**, you must have the **DELETE** privilege for the `mysql.plugin` table.

Plugin removal has implications for the use of associated tables. For example, if a full-text parser plugin is associated with a **FULL-TEXT** index on the table, uninstalling the plugin makes the table unusable. Any attempt to access the table results in an error. The table cannot even be opened, so you cannot drop an index for which the plugin is used. This means that uninstalling a plugin is something to do with care unless you do not care about the table contents. If you are uninstalling a plugin with no intention of reinstalling it later and you care about the table contents, you should dump the table with `mysqldump` and remove the **WITH PARSE** clause from the dumped **CREATE TABLE** statement so that you can reload the table later. If you do not care about the table, **DROP TABLE** can be used even if any plugins associated with the table are missing.

28.2.5. Writing Plugins

This section describes the general and type-specific parts of the plugin API. It also provides a step-by-step guide to creating a plugin library. For example plugin source code, see the `plugin/fulltext` directory of a MySQL source distribution.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plu-

gins that were originally written for older servers. For information about these constraints, see [Section 2.9.2, “Typical configure Options”](#), and [Section 2.9.4, “Dealing with Problems Compiling MySQL”](#).

28.2.5.1. General Plugin Structures and Functions

Every plugin must have a general plugin declaration. The declaration corresponds to the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
  int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
  void *info;         /* pointer to type-specific plugin descriptor */
  const char *name;   /* plugin name */
  const char *author; /* plugin author (for SHOW PLUGINS) */
  const char *descr;  /* general descriptive text (for SHOW PLUGINS) */
  int license;        /* the plugin license (PLUGIN_LICENSE_XXX) */
  int (*init)(void *); /* the function to invoke when plugin is loaded */
  int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for SHOW PLUGINS) */
  struct st_mysql_show_var *status_vars;
  void * __reserved1; /* placeholder for system variables */
  void * __reserved2; /* placeholder for config options */
};
```

The `st_mysql_plugin` structure is common to every type of plugin. Its members should be filled in as follows:

- type**

The plugin type. This must be one of the plugin-type values from `plugin.h`. For a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- info**

A pointer to the descriptor for the plugin. Unlike the general plugin declaration structure, this descriptor's structure depends on the particular type of plugin. Each descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. The descriptor for full-text plugins is described in [Section 28.2.5.2, “Type-Specific Plugin Structures and Functions”](#).

- name**

The plugin name. This is the name that will be listed in the `plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- author**

The plugin author. This can be whatever you like.

- descr**

A general description of the plugin. This can be whatever you like.

- license**

The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- init**

A once-only initialization function. This is executed when the plugin is loaded, which happens for `INSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server startup. The function takes no arguments. It returns zero for success and non-zero for failure. If an `init` function is unneeded for a plugin, it can be specified as 0.

- deinit**

A once-only deinitialization function. This is executed when the plugin is unloaded, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and non-zero for failure. If a `deinit` function is unneeded for a plugin, it can be specified as 0.

- version**

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

- `__reserved1, __reserved2`

These are placeholders for the future. Currently, they should be set to `NULL`.

The `init` and `deinit` functions in the general plugin declaration are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be:

Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LOONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this calling sequence:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

Plugins should consider the `thd` parameter to be read-only.

28.2.5.2. Type-Specific Plugin Structures and Functions

In the `st_mysql_plugin` structure that defines a plugin's general declaration, the `info` member points to a type-specific plugin descriptor. For a full-text parser plugin, the descriptor corresponds to the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

```
};
```

As shown by the structure definition, the descriptor has a version number (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) and contains pointers to three functions. The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

Note that the plugin declaration in the plugin library descriptor has initialization and deinitialization functions, and so does the plugin descriptor to which it points. These pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the plugin library descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or non-zero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                      char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

Note

The definition shown is current as of MySQL 5.1.12. It is incompatible with versions of MySQL 5.1 older than 5.1.12.

The structure members are used as follows:

- `mysql_parse`

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a

piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

A pointer to the text to be parsed.

- `length`

The length of the text to be parsed, in bytes.

- `flags`

Parser flags. This is zero if there are no special flags. Currently, the only non-zero flag is `MYSQL_FTFIELDS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.) This member was added in MySQL 5.1.12.

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

The parsing mode. This value will be one of the following constants:

- `MYSQL_FTPARSER_SIMPLE_MODE`

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- `MYSQL_FTPARSER_WITH_STOPWORDS`

Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The

`MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    bool wasign;
    bool trunc;
    /* These are parser state and must be removed. */
    byte prev;
    byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

The token type. This should be one of values shown in the following table:

Type	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word
<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopword

- `yesno`

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 11.8.1, “Boolean Full-Text Searches”](#), that use the `<` and `>` operators illustrate how weighting works.

- `wasign`

The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

28.2.5.3. Creating a Plugin Library

This section provides a step-by-step procedure for creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are non-empty runs of whitespace characters.

Each plugin library has the following contents:

- A plugin library descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library.
- Each plugin general declaration contains information that is common to all types of plugin: A value that indicates the plugin type;

the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.

- The plugin general declaration also contains a pointer to a type-specific plugin descriptor. The structure of these descriptors can vary from one plugin type to another, because each type of plugin can have its own API. A plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the library descriptor and by the plugin descriptors.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of a MySQL source distribution. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.1` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.1/plugin/fulltext/* fulltext_plugin
```

If you are copying files from a BitKeeper source tree, `cp` will display an error message about the `SCCS` directory, which you can ignore.

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

```
shell> cd fulltext_plugin
```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

3. Set up the plugin library file descriptor.

Every plugin library must include a library descriptor that must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the library descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    "simple_parser",             /* name */
    "MySQL AB",                 /* author */
    "Simple Full-Text Parser",   /* description */
    PLUGIN_LICENSE_GPL,         /* plugin license */
}
```

```

    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
mysql_declare_plugin_end;

```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

The `mysql_declare_plugin` and `mysql_declare_plugin_end` macros are defined in `plugin.h` like this:

```

#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
int PSIZE= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin DECLS[]= { \
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin _mysql_plugin_declarations[]= { \
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end , {0,0,0,0,0,0,0,0,0}}

```

One point to note about those definitions is that the `_mysql_plugin_interface_version` symbol is defined only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you'll need to provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```

int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION;
struct st_mysql_plugin _mysql_plugin_declarations[]= {
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
    "MySQL AB", /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
, {0,0,0,0,0,0,0,0,0}}
};

```

The preceding example declares a single plugin in the library descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. See the discussion at the end of this section that describes some legal and illegal initializers for plugins.

4. Set up the plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```

static struct st_mysql_ftparser simple_parser_descriptor=
{

```

```

MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
simple_parser_parse,               /* parsing function */
simple_parser_init,                /* parser init function */
simple_parser_deinit               /* parser deinit function */
};

```

5. Set up the plugin interface functions.

The general plugin declaration in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```

static int simple_parser_plugin_init(void)
{
    return(0);
}

static int simple_parser_plugin_deinit(void)
{
    return(0);
}

```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```

static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}

```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers non-empty runs of whitespace characters to be words, so it identifies words like this:

```

static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;
    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
        else if (isspace(*end))
        {
            if (end > start)
                add_word(param, start, end - start);
            start= end + 1;
        }
    }
    return(0);
}

```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```

static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, '-', 0 };
}

```

```

    param->mysql_add_word(param, word, len, &bool_info);
}
    
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 28.2.5.2](#), “Type-Specific Plugin Structures and Functions”.

- Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```

long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
    {"static", (char *)"just a static text", SHOW_CHAR},
    {"called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};
    
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```

mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value               |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0                   |
+-----+-----+
    
```

- Compile the plugin library as a shared library and install it in the plugin directory.

Note

As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The filename might have a different extension on your system.)

To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

Edit `Makefile.am`, which should look something like this:

```

#Makefile.am example for a plugin

pkglibdir=$(libdir)/mysql
INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
#noinst_LTLIBRARIES= mypluglib_la
pkglib_LTLIBRARIES= mypluglib_la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkglibdir)
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
    
```

The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

Adjust the `INCLUDES` line to specify the pathname to the installed MySQL header files. Edit it to look like this:

```

INCLUDES= -I/usr/local/mysql/include
    
```

Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

Set up the files needed for the `configure` command, invoke it, and run `make`:

```
shell> autoreconf --force --install --symlink
shell> ./configure --prefix=/usr/local/mysql
shell> make
```

The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| base          | /usr/local/mysql    |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions allow it to be executed by the server.

8. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to list the plugin in the `plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name      | dl                |
+-----+-----+
| simple_parser | libmypluglib.so |
+-----+-----+
1 row in set (0.00 sec)
```

9. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
-> FULLTEXT (c) WITH PARSER simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all non-whitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
-> ('latin1_general_cs is a case-sensitive collation'),
-> ('I\'d like a case of oranges'),
-> ('this is sensitive information'),
-> ('another row'),
-> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT c FROM t;
+-----+
| c                |
+-----+
```

```
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges                     |
| this is sensitive information                  |
| another row                                   |
| yet another row                               |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
|                          |
|          0               |
| 1.2968142032623         |
|          0               |
|          0               |
|          0               |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
|                                |
|                                |
|          0                   |
| 1.3253291845322             |
|          0                   |
|          0                   |
|          0                   |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
|                                     |
|                                     |
|          0                         |
| 1.3109166622162                 |
|          0                         |
|          0                         |
|          0                         |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
| MATCH(c) AGAINST('I\'d') |
+-----+
|                          |
|          0               |
| 1.2968142032623         |
|          0               |
|          0               |
|          0               |
+-----+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
    "MySQL AB", /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
mysql_declare_plugin_end;
```

Here is another valid way to write the descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "MySQL AB";
```

```
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    simple_parser_name, /* name */
    simple_parser_author, /* author */
    simple_parser_description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
mysql_declare_plugin_end;
```

However, the following descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "MySQL AB",
    "Simple Full-Text Parser"
};

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    parser_info.name, /* name */
    parser_info.author, /* author */
    parser_info.description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status /* status variables */
}
mysql_declare_plugin_end;
```

28.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the [CREATE FUNCTION](#) and [DROP FUNCTION](#) statements. See [Section 28.3.2, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Chapter 19, Stored Procedures and Functions](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

28.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

28.3.2. CREATE FUNCTION Syntax

```
CREATE [AGGREGATE] FUNCTION function_name RETURNS {STRING|INTEGER|REAL|DECIMAL}
SONAME shared_library_name
```

A user-defined function (UDF) is a way to extend MySQL with a new function that works like a native (built-in) MySQL function such as `ABS()` or `CONCAT()`.

function_name is the name that should be used in SQL statements to invoke the function. The `RETURNS` clause indicates the type of the function's return value. `DECIMAL` is a legal value after `RETURNS`, but currently `DECIMAL` functions return string values and should be written like `STRING` functions.

shared_library_name is the basename of the shared object file that contains the code that implements the function. The file must be located in the plugin directory. This directory is given by the value of the `plugin_dir` system variable. (**Note:** This a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

To create a function, you must have the `INSERT` privilege for the `mysql` database. This is necessary because `CREATE FUNCTION` adds a row to the `mysql.func` system table that records the function's name, type, and shared library name. If you do not have this table, you should run the `mysql_upgrade` command to create it. See [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

For instructions on writing user-defined functions, see [Section 28.3.4, “Adding a New User-Defined Function”](#). For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

An `AGGREGATE` function works exactly like a native MySQL aggregate (summary) function such as `SUM` or `COUNT()`. For `AGGREGATE` to work, your `mysql.func` table must contain a `type` column. If your `mysql.func` table does not have this column, you should run the `mysql_upgrade` program to create it (see [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#)).

28.3.3. DROP FUNCTION Syntax

```
DROP FUNCTION function_name
```

This statement drops the user-defined function (UDF) named *function_name*.

To drop a function, you must have the **DELETE** privilege for the **mysql** database. This is because **DROP FUNCTION** removes a row from the **mysql.func** system table that records the function's name, type, and shared library name.

28.3.4. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. The MySQL source distribution includes a file **sql/udf_example.c** that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the **include/mysql_com.h** header file. (You need not include this header file directly because it is included by **mysql.h**.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the **libstdc++** library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.2, “Typical configure Options”](#), and [Section 2.9.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link **mysqld** dynamically. Don't configure MySQL using **-with-mysqld-ldflags=-all-static**. If you want to use a UDF that needs to access symbols from **mysqld** (for example, the **metaphone** function in **sql/udf_example.c** that uses **default_charset_info**), you must link the program with **-rdynamic** (see [man dlopen](#)). If you plan to use UDFs, the rule of thumb is to configure MySQL with **-with-mysqld-ldflags=-rdynamic** unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, **XXX()** (uppercase) indicates an SQL function call, and **xxx()** (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for **xxx()** are:

- **xxx()** (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here:

SQL Type	C/C++ Type
STRING	char *
INTEGER	long long
REAL	double

It is also possible to declare a **DECIMAL** function, but currently the value is returned as a string, so you should write the UDF as though it were a **STRING** function. **ROW** functions are not implemented.

- **xxx_init()** (optional)

The initialization function for **xxx()**. It can be used for the following purposes:

- To check the number of arguments to **XXX()**.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for **REAL** functions) the maximum number of decimal places in the result.
- To specify whether the result can be **NULL**.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()` (required in 5.1)

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()` (required)

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each new row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

28.3.4.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 28.3.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```

DECIMAL functions return string values and should be declared the same way as **STRING** functions. **ROW** functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The **initid** parameter is passed to all three functions. It points to a **UDF_INIT** structure that is used to communicate information between functions. The **UDF_INIT** structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- **my_bool maybe_null**

xxx_init() should set **maybe_null** to 1 if **xxx()** can return **NULL**. The default value is 1 if any of the arguments are declared **maybe_null**.

- **unsigned int decimals**

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. (For example, if the function is passed **1.34**, **1.345**, and **1.3**, the default would be 3, because **1.345** has 3 decimal digits.

- **unsigned int max_length**

The maximum length of the result. The default **max_length** value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by **initid->decimals**. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set **max_length** to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- **char *ptr**

A pointer that the function can use for its own purposes. For example, functions can use **initid->ptr** to communicate allocated memory among themselves. **xxx_init()** should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In **xxx()** and **xxx_deinit()**, refer to **initid->ptr** to use or deallocate the memory.

- **my_bool const_item**

xxx_init() should set **const_item** to 1 if **xxx()** always returns the same value and to 0 otherwise.

28.3.4.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 28.3.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- **xxx_reset()**

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given **UDF_ARGS** argument as the first value in your internal summary value for the group. Declare **xxx_reset()** as follows:

```
char *xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.1, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
char *xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.1.

- `xxx_add()`

This function is called for all rows that belong to the same group, except for the first row. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
char *xxx_add(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 28.3.4.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 28.3.4.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 28.3.4.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

28.3.4.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "xxx() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index

values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (`0`). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

28.3.4.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*result` and `*length` to the contents and length of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

The `result` buffer that is passed to the `xxx()` function is 255 bytes long. If your result fits in this, you don't have to worry about memory allocation for results.

If your string function needs to return a string longer than 255 bytes, you must allocate the space for it with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 28.3.4.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

28.3.4.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it's more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a hostname.
- `reverse_lookup()` returns the hostname for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable. (**Note:** This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the BitKeeper source repository for MySQL 5.1. See [Section 2.9.3, "Installing from the Development Source Tree"](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wssock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphor RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.so';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphor;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

28.3.4.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legit-

imate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable. (**Note:** This a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.)

28.3.5. Adding a New Native Function

The procedure for adding a new native function is described here. Note that you cannot add native functions to a binary distribution because the procedure involves modifying MySQL source code. You must compile MySQL yourself from a source distribution. Also note that if you migrate to another version of MySQL (for example, when a new version is released), you need to repeat the procedure with the new version.

To add a new native MySQL function, follow these steps:

1. Add one line to `lex.h` that defines the function name in the `sql_functions[]` array.
2. If the function prototype is simple (just takes zero, one, two or three arguments), you should in `lex.h` specify `SYM(FUNC_ARGN)` (where *N* is the number of arguments) as the second argument in the `sql_functions[]` array and add a function that creates a function object in `item_create.cc`. Take a look at "ABS" and `create_funcs_abs()` for an example of this.

If the function prototype is complicated (for example, if it takes a variable number of arguments), you should add two lines to `sql_yacc.yy`. One indicates the preprocessor symbol that `yacc` should define (this should be added at the beginning of the file). Then define the function parameters and add an "item" with these parameters to the `simple_expr` parsing rule. For an example, check all occurrences of `ATAN` in `sql_yacc.yy` to see how this is done.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, you should include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. You can take a look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, don't use any global or static variables in the functions without protecting them with mutexes)

If you want to return `NULL`, from `::val()`, `::val_int()` or `::str()` you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are some additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

28.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at [mylua](#). With this you can use the LUA language to load a procedure at runtime into `mysqld`.

28.4.1. Procedure Analyse

`analyse([max_elements],[max_memory])`

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements],[max_memory])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

28.4.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

Appendix A. MySQL 5.1 Frequently Asked Questions

A.1. MySQL 5.1 FAQ — General

Questions

- [30.1.1](#): When did MySQL 5.1 become production-ready (GA)?
- [30.1.2](#): Can MySQL 5.1 do subqueries?
- [30.1.3](#): Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?
- [30.1.4](#): Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?
- [30.1.5](#): Does MySQL 5.1 have Sequences?
- [30.1.6](#): Does MySQL 5.1 have a `NOW()` function with fractions of seconds?
- [30.1.7](#): Does MySQL 5.1 work with multi-core processors?
- [30.1.8](#): Is there a hot backup tool for MyISAM like InnoDB Hot Backup?
- [30.1.9](#): Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- [30.1.10](#): Can MySQL 5.1 perform ACID transactions?

Questions and Answers

30.1.1: When did MySQL 5.1 become production-ready (GA)?

MySQL 5.0.15 was released for production use on 19 October 2005. We are now working on MySQL 5.1, which is currently in beta.

30.1.2: Can MySQL 5.1 do subqueries?

Yes. See [Section 12.2.8](#), “Subquery Syntax”.

30.1.3: Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.10](#), “UPDATE Syntax”; for that required to perform multiple-table deletes, see [Section 12.2.1](#), “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 20.3](#), “Using Triggers”.

30.1.4: Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 6.5.4](#), “The MySQL Query Cache”.

30.1.5: Does MySQL 5.1 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.1 can also handle inserts in a multi-master replication setup. With the `--auto-increment-increment` and `--auto-increment-offset` startup options, you can set each server to generate auto-increment values that don't conflict with other servers. The `--auto-increment-increment` value should be greater than the number of servers, and each server should have a unique offset.

30.1.6: Does MySQL 5.1 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2, “The TIME Type”](#).

30.1.7: Does MySQL 5.1 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

30.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

30.1.9: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in [InnoDB](#) has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 5.2; this should resolve any inadequacies in the current storage engine specific implementation.

30.1.10: Can MySQL 5.1 perform ACID transactions?

Yes. All current MySQL versions support transactions. The [InnoDB](#) storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The [NDB](#) storage engine supports the [READ COMMITTED](#) transaction isolation level only.

A.2. MySQL 5.1 FAQ — Storage Engines

Questions

- [30.2.1](#): Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?
- [30.2.2](#): Are there any new storage engines in MySQL 5.1?
- [30.2.3](#): Have any storage engines been removed in MySQL 5.1?
- [30.2.4](#): What are the unique benefits of the [ARCHIVE](#) storage engine?
- [30.2.5](#): Do the new features in MySQL 5.1 apply to all storage engines?

Questions and Answers

30.2.1: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?

See [Chapter 13, Storage Engines](#). That chapter contains information about all MySQL storage engines except for the [NDB](#) storage engine used for MySQL Cluster; [NDB](#) is covered in [Chapter 16, MySQL Cluster](#).

MySQL Enterprise

For expert advice about the storage engine(s) most suitable to your circumstances subscribe to the MySQL Enterprise Monitor. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

30.2.2: Are there any new storage engines in MySQL 5.1?

MySQL 5.1 introduces an alpha version of the new Falcon storage engine.

Falcon support is not available in the standard MySQL 5.1 release. Falcon is available only in a specially forked release of MySQL 5.1. Information is provided here for evaluation purposes only.

For information about the Falcon storage engine, see [Using Falcon](#).

There have also been significant improvements in existing storage engines, in particular for the [NDB](#) storage engine that forms the basis for MySQL Cluster.

30.2.3: Have any storage engines been removed in MySQL 5.1?

Yes. MySQL 5.1 no longer supports the [BDB](#) storage engine. Any existing [BDB](#) tables should be converted to another storage engine before upgrading to MySQL 5.1.

30.2.4: What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.10, “The ARCHIVE Storage Engine”](#), for details.

30.2.5: Do the new features in MySQL 5.1 apply to all storage engines?

The general new features such as views, stored procedures, triggers, [INFORMATION_SCHEMA](#), precision math ([DECIMAL](#) column type), and the [BIT](#) column type, apply to all storage engines. There are also additions and changes for specific storage engines.

A.3. MySQL 5.1 FAQ — Server SQL Mode

Questions

- [30.3.1](#): What are server SQL modes?
- [30.3.2](#): How many server SQL modes are there?
- [30.3.3](#): How do you determine the server SQL mode?
- [30.3.4](#): Is the mode dependent on the database or connection?
- [30.3.5](#): Can the rules for strict mode be extended?
- [30.3.6](#): Does strict mode impact performance?
- [30.3.7](#): What is the default server SQL mode when MySQL 5.1 is installed?

Questions and Answers

30.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server applies these modes individually to different clients. For more information, see [Section 5.2.6, “SQL Modes”](#).

30.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.2.6, “SQL Modes”](#), for a complete list of available modes.

30.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [SESSION|GLOBAL] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

30.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. You can change these settings using `SET [SESSION|GLOBAL] sql_mode='modes'`.

30.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes [TRADITIONAL](#), [STRICT_TRANS_TABLES](#), or [STRICT_ALL_TABLES](#) is enabled. Options can be combined, so you can add additional restrictions to a mode. See [Section 5.2.6, “SQL Modes”](#), for more information.

30.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

30.3.7: What is the default server SQL mode when MySQL 5.1 is installed?

By default, no special modes are enabled. See [Section 5.2.6, “SQL Modes”](#), for information about all available modes and MySQL's default behavior.

A.4. MySQL 5.1 FAQ — Stored Procedures

Questions

- [30.4.1](#): Does MySQL 5.1 support stored procedures?
- [30.4.2](#): Where can I find documentation for MySQL stored procedures and stored functions?
- [30.4.3](#): Is there a discussion forum for MySQL stored procedures?
- [30.4.4](#): Where can I find the ANSI SQL 2003 specification for stored procedures?
- [30.4.5](#): How do you manage stored routines?
- [30.4.6](#): Is there a way to view all stored procedures and stored functions in a given database?
- [30.4.7](#): Where are stored procedures stored?
- [30.4.8](#): Is it possible to group stored procedures or stored functions into packages?
- [30.4.9](#): Can a stored procedure call another stored procedure?
- [30.4.10](#): Can a stored procedure call a trigger?
- [30.4.11](#): Can a stored procedure access tables?
- [30.4.12](#): Do stored procedures have a statement for raising application errors?
- [30.4.13](#): Do stored procedures provide exception handling?
- [30.4.14](#): Can MySQL 5.1 stored routines return result sets?
- [30.4.15](#): Is [WITH RECOMPILE](#) supported for stored procedures?
- [30.4.16](#): Is there a MySQL equivalent to using [mod_plsql](#) as a gateway on Apache to talk directly to a stored procedure in the database?
- [30.4.17](#): Can I pass an array as input to a stored procedure?
- [30.4.18](#): Can I pass a cursor as an [IN](#) parameter to a stored procedure?
- [30.4.19](#): Can I return a cursor as an [OUT](#) parameter from a stored procedure?
- [30.4.20](#): Can I print out a variable's value within a stored routine for debugging purposes?
- [30.4.21](#): Can I commit or roll back transactions inside a stored procedure?
- [30.4.22](#): Do MySQL 5.1 stored procedures and functions work with replication?
- [30.4.23](#): Are stored procedures and functions created on a master server replicated to a slave?
- [30.4.24](#): How are actions that take place inside stored procedures and functions replicated?
- [30.4.25](#): Are there special security requirements for using stored procedures and functions together with replication?
- [30.4.26](#): What limitations exist for replicating stored procedure and function actions?
- [30.4.27](#): Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [30.4.28](#): What is being done to correct the aforementioned limitations?

Questions and Answers

30.4.1: Does MySQL 5.1 support stored procedures?

Yes. MySQL 5.1 supports two types of stored routines — stored procedures and stored functions.

30.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See [Chapter 19, *Stored Procedures and Functions*](#).

30.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

30.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

30.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 23.14, “The INFORMATION_SCHEMA ROUTINES Table”](#)).

30.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see [Section 23.14, “The INFORMATION_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.5.4.8, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information.

30.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.5.4.8, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see [Section 23.14, “The INFORMATION_SCHEMA ROUTINES Table”](#), for information about this table.

30.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.1.

30.4.9: Can a stored procedure call another stored procedure?

Yes.

30.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to fire.

30.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

30.4.12: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.1. We intend to implement the SQL standard [SIGNAL](#) and [RESIGNAL](#) statements in a future MySQL release.

30.4.13: Do stored procedures provide exception handling?

MySQL implements [HANDLER](#) definitions according to the SQL standard. See [Section 19.2.8.2, “DECLARE Handlers”](#), for details.

30.4.14: Can MySQL 5.1 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary [SELECT](#) inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the [mysqli](#) extension rather than the old [mysql](#) extension.

30.4.15: Is [WITH RECOMPILE](#) supported for stored procedures?

Not in MySQL 5.1.

30.4.16: Is there a MySQL equivalent to using [mod_php](#) as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.1.

30.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.1.

30.4.18: Can I pass a cursor as an [IN](#) parameter to a stored procedure?

In MySQL 5.1, cursors are available inside stored procedures only.

30.4.19: Can I return a cursor as an [OUT](#) parameter from a stored procedure?

In MySQL 5.1, cursors are available inside stored procedures only. However, if you do not open a cursor on a [SELECT](#), the result will be sent directly to the client. You can also [SELECT INTO](#) variables. See [Section 12.2.7, “SELECT Syntax”](#).

30.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary [SELECT](#) inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the [mysqli](#) extension rather than the old [mysql](#) extension.

30.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

30.4.22: Do MySQL 5.1 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 19.4, “Binary Logging of Stored Routines and Triggers”](#).

30.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. [ALTER](#) and [DROP](#) statements for stored procedures and functions are also replicated.

30.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

30.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active,

then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the [SUPER](#) privilege.
2. Alternatively, a DBA can set the [log_bin_trust_function_creators](#) system variable to 1, which enables anyone with the standard [CREATE ROUTINE](#) privilege to create stored functions.

30.4.26: What limitations exist for replicating stored procedure and function actions?

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be [DETERMINISTIC](#) or setting the [log_bin_trust_function_creators](#) system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the [IGNORE](#) keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

30.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

30.4.28: What is being done to correct the aforementioned limitations?

As of MySQL 5.1.5, you can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Beginning with MySQL 5.1.8, *mixed* replication is also available (by starting the server with [--binlog-format=mixed](#)). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 15.1.2, “Replication Formats”](#).

A.5. MySQL 5.1 FAQ — Triggers

Questions

- [30.5.1](#): Where can I find the documentation for MySQL 5.1 triggers?
- [30.5.2](#): Is there a discussion forum for MySQL Triggers?
- [30.5.3](#): Does MySQL 5.1 have statement-level or row-level triggers?
- [30.5.4](#): Are there any default triggers?
- [30.5.5](#): How are triggers managed in MySQL?
- [30.5.6](#): Is there a way to view all triggers in a given database?
- [30.5.7](#): Where are triggers stored?
- [30.5.8](#): Can a trigger call a stored procedure?
- [30.5.9](#): Can triggers access tables?
- [30.5.10](#): Can triggers call an external application through a UDF?
- [30.5.11](#): Is possible for a trigger to update tables on a remote server?
- [30.5.12](#): Do triggers work with replication?

- [30.5.13](#): How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

30.5.1: Where can I find the documentation for MySQL 5.1 triggers?

See [Chapter 20, Triggers](#).

30.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at <http://forums.mysql.com/list.php?99>.

30.5.3: Does MySQL 5.1 have statement-level or row-level triggers?

In MySQL 5.1, all triggers are **FOR EACH ROW** — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.1 does not support triggers using **FOR EACH STATEMENT**.

30.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some **TIMESTAMP** columns, as well as for columns which are defined using **AUTO_INCREMENT**.

30.5.5: How are triggers managed in MySQL?

In MySQL 5.1, triggers can be created using the **CREATE TRIGGER** statement, and dropped using **DROP TRIGGER**. See [Section 20.1, “CREATE TRIGGER Syntax”](#), and [Section 20.2, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the **INFORMATION_SCHEMA.TRIGGERS** table. See [Section 23.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

30.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database **dbname** using a query on the **INFORMATION_SCHEMA.TRIGGERS** table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see [Section 23.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

You can also use the **SHOW TRIGGERS** statement, which is specific to MySQL. See [Section 12.5.4.30, “SHOW TRIGGERS Syntax”](#).

30.5.7: Where are triggers stored?

Triggers are currently stored in **.TRG** files, with one such file one per table. In other words, a trigger belongs to a table.

In the future, we plan to change this so that trigger information will be included in the **.FRM** file that defines the structure of the table. We also plan to make triggers database-level objects — rather than table-level objects as they are now — to bring them into compliance with the SQL standard.

30.5.8: Can a trigger call a stored procedure?

Yes.

30.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. Through a stored procedure, or a multiple-table update or delete statement, a trigger can also affect other tables.

30.5.10: Can triggers call an external application through a UDF?

No, not at present.

30.5.11: Is possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the [FEDERATED](#) storage engine. (See [Section 13.9](#), “[The FEDERATED Storage Engine](#)”).

30.5.12: Do triggers work with replication?

Triggers and replication in MySQL 5.1 work in the same way as in most other database engines: Actions carried out through triggers on a master are not replicated to a slave server. Instead, triggers that exist on tables that reside on a MySQL master server need to be created on the corresponding tables on any MySQL slave servers so that the triggers activate on the slaves as well as the master.

30.5.13: How are actions carried out through triggers on a master replicated to a slave?

First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table [EMP](#) that has an [AFTER](#) insert trigger, which exists on a master MySQL server. The same [EMP](#) table and [AFTER](#) insert trigger exist on the slave server as well. The replication flow would be:

1. An [INSERT](#) statement is made to [EMP](#).
2. The [AFTER](#) trigger on [EMP](#) activates.
3. The [INSERT](#) statement is written to the binary log.
4. The replication slave picks up the [INSERT](#) statement to [EMP](#) and executes it.
5. The [AFTER](#) trigger on [EMP](#) that exists on the slave activates.

A.6. MySQL 5.1 FAQ — Views

Questions

- [30.6.1](#): Where can I find documentation covering MySQL Views?
- [30.6.2](#): Is there a discussion forum for MySQL Views?
- [30.6.3](#): What happens to a view if an underlying table is dropped or renamed?
- [30.6.4](#): Does MySQL 5.1 have table snapshots?
- [30.6.5](#): Does MySQL 5.1 have materialized views?
- [30.6.6](#): Can you insert into views that are based on joins?

Questions and Answers

30.6.1: Where can I find documentation covering MySQL Views?

See [Chapter 22](#), [Views](#).

30.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

30.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the [CHECK TABLE](#) statement. (See [Section 12.5.2.3](#), “[CHECK TABLE Syntax](#)”).

30.6.4: Does MySQL 5.1 have table snapshots?

No.

30.6.5: Does MySQL 5.1 have materialized views?

No.

30.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there's only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.0 FAQ — INFORMATION_SCHEMA

Questions

- [30.7.1](#): Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- [30.7.2](#): Is there a discussion forum for `INFORMATION_SCHEMA`?
- [30.7.3](#): Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- [30.7.4](#): What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- [30.7.5](#): Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

30.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 23, The `INFORMATION\_SCHEMA` Database](#)

30.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

30.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

30.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

30.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *MySQL AB cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

A.8. MySQL 5.1 FAQ — Migration

Questions

- [30.8.1](#): Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?
- [30.8.2](#): How has storage engine (table type) support changed in MySQL 5.1 from previous versions?

Questions and Answers

30.8.1: Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?

For detailed upgrade information, see [Section 2.11, “Upgrading MySQL”](#). We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will save you time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Network subscription — by MySQL support.

30.8.2: How has storage engine (table type) support changed in MySQL 5.1 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table *tblname* from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in filesystems that did not support file sizes greater than 2GB. All modern filesystems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

A.9. MySQL 5.1 FAQ — Security

Questions

- [30.9.1](#): Where can I find documentation that addresses security issues for MySQL?
- [30.9.2](#): Does MySQL 5.1 have native support for SSL?
- [30.9.3](#): Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?
- [30.9.4](#): Does MySQL 5.1 have built-in authentication against LDAP directories?
- [30.9.5](#): Does MySQL 5.1 include support for Roles Based Access Control (RBAC)?

Questions and Answers

30.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.6, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.6.1, “General Security Guidelines”](#).
- [Section 5.6.2, “Making MySQL Secure Against Attackers”](#).
- [Section B.1.4.1, “How to Reset the Root Password”](#).
- [Section 5.6.5, “How to Run MySQL as a Normal User”](#).
- [Section 28.3.4.6, “User-Defined Function Security Precautions”](#).
- [Section 5.6.3, “Security-Related `mysqld` Options”](#).
- [Section 5.6.4, “Security Issues with `LOAD DATA LOCAL`”](#).
- [Section 2.10, “Post-Installation Setup and Testing”](#).

- [Section 2.13.1.11, “SELinux Notes”](#).
- [Section 5.8.7.1, “Basic SSL Concepts”](#).

MySQL Enterprise

The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

30.9.2: Does MySQL 5.1 have native support for SSL?

Most 5.1 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it's still quite new and does not compile on all platforms yet. See [Section 5.8.7, “Using Secure Connections”](#).

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see [Section 5.8.7.5, “Connecting to MySQL Remotely from Windows with SSH”](#).

30.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.1 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.8.7, “Using Secure Connections”](#), for a complete listing of supported and unsupported platforms.

30.9.4: Does MySQL 5.1 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

30.9.5: Does MySQL 5.1 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 5.1 FAQ — MySQL Cluster

In the following section, we provide answers to questions that are most frequently asked about MySQL Cluster and the [NDB](#) storage engine.

Questions

- [30.10.1](#): What does “NDB” mean?
- [30.10.2](#): What's the difference in using Cluster vs using replication?
- [30.10.3](#): Do I need to do any special networking to run Cluster? How do computers in a cluster communicate?
- [30.10.4](#): How many computers do I need to run a cluster, and why?
- [30.10.5](#): What do the different computers do in a MySQL Cluster?
- [30.10.6](#): With which operating systems can I use Cluster?
- [30.10.7](#): What are the hardware requirements for running MySQL Cluster?
- [30.10.8](#): How much RAM do I need? Is it possible to use disk memory at all?
- [30.10.9](#): What filesystems can I use with MySQL Cluster? What about network filesystems or network shares?
- [30.10.10](#): Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?
- [30.10.11](#): I'm trying to populate a Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL
```

Why is this happening?

- [30.10.12](#): MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?
- [30.10.13](#): Do I have to learn a new programming or query language to use MySQL Cluster?
- [30.10.14](#): How do I find out what an error or warning message means when using MySQL Cluster?
- [30.10.15](#): Is MySQL Cluster transaction-safe? What isolation levels are supported?
- [30.10.16](#): What storage engines are supported by MySQL Cluster?
- [30.10.17](#): Which versions of the MySQL software support Cluster? Do I have to compile from source?
- [30.10.18](#): In the event of a catastrophic failure — say, for instance, the whole city loses power *and* my UPS fails — would I lose all my data?
- [30.10.19](#): Is it possible to use [FULLTEXT](#) indexes with Cluster?
- [30.10.20](#): Can I run multiple nodes on a single computer?
- [30.10.21](#): Can I add nodes to a cluster without restarting it?
- [30.10.22](#): Are there any limitations that I should be aware of when using MySQL Cluster?
- [30.10.23](#): How do I import an existing MySQL database into a cluster?
- [30.10.24](#): How do cluster nodes communicate with one another?
- [30.10.25](#): What is an *arbitrator*?
- [30.10.26](#): What data types are supported by MySQL Cluster?
- [30.10.27](#): How do I start and stop MySQL Cluster?
- [30.10.28](#): What happens to cluster data when the cluster is shut down?
- [30.10.29](#): Is it helpful to have more than one management node for a cluster?
- [30.10.30](#): Can I mix different kinds of hardware and operating systems in one MySQL Cluster?
- [30.10.31](#): Can I run two data nodes on a single host? Two SQL nodes?
- [30.10.32](#): Can I use hostnames with MySQL Cluster?
- [30.10.33](#): How do I handle MySQL users in a Cluster having multiple MySQL servers?

Questions and Answers

30.10.1: What does “NDB” mean?

This stands for “Network Database”. [NDB](#) (also known as [NDB Cluster](#) or [NDBCLUSTER](#)) is the storage engine that enables clustering in MySQL.

30.10.2: What's the difference in using Cluster vs using replication?

In a replication setup, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is asynchronous, MySQL Cluster is synchronous.

We have implemented (asynchronous) replication for Cluster in MySQL 5.1. This includes the capability to replicate both between two clusters, and from a MySQL cluster to a non-Cluster MySQL server. See [Section 16.10, “MySQL Cluster Replication”](#).

30.10.3: Do I need to do any special networking to run Cluster? How do computers in a cluster communicate?

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Section 16.12, “Using High-Speed Interconnects with MySQL Cluster”](#), for more information about SCI.

30.10.4: How many computers do I need to run a cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

30.10.5: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node (MGM node):** Provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster via the MGM node is `ndb_mgm`.
- **Data node:** Stores and replicates data. Data node functionality is handled by an instance of the NDB data node process `ndbd`.
- **SQL node:** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the **NDB Cluster** storage engine and started with the `--ndb-cluster` option to enable the engine.

30.10.6: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, BSD, HP-UX, AIX, and IRIX, among others, as well as Novell Netware. Cluster is not supported for Windows at this time. However, we are working to add Cluster support for other platforms, including Windows, and our goal is to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

30.10.7: What are the hardware requirements for running MySQL Cluster?

Cluster should run on any platform for which NDB-enabled binaries are available. Naturally, faster CPUs and more memory will improve performance, and 64-bit CPUs will likely be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required.

30.10.8: How much RAM do I need? Is it possible to use disk memory at all?

Previous to MySQL 5.1, Cluster was in-memory only. This meant that all table data (including indexes) was stored in RAM. If your data took up 1GB of space and you wanted to replicate it once in the cluster, you needed 2GB of memory to do so (1 GB per replica). This was in addition to the memory required by the operating system and any applications running on the cluster computers. This is still true of in-memory tables.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for **DataMemory**. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In

any case, once the [DataMemory](#) limit is reached, any operations requiring additional memory (such as inserts) will fail.

[NDB Cluster](#) in MySQL 5.1 includes support for Disk Data, which helps to alleviate these issues. See [Section 16.11, “MySQL Cluster Disk Data Tables”](#), for more information.

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 10.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an [NDBCluster](#) table requires 21–25 bytes per record. These indexes use [IndexMemory](#).
- Each ordered index requires 10 bytes storage per record, using [DataMemory](#).
- Creating a primary key or unique index also creates an ordered index, unless this index is created with [USING HASH](#). In other words:
 - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
 - However, if the primary key or unique index is created with [USING HASH](#), then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with [USING HASH](#) for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by as much as 20 to 30 percent faster than updates on tables where [USING HASH](#) was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the [ndb_size.pl](#) utility which is available in recent MySQL 5.1 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the [NDBCluster](#) storage engine. For more information, see [Section 16.9.15, “ndb_size.pl — NDBCluster Size Requirement Estimator”](#).

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The [NDB](#) storage engine creates a primary key automatically if none is defined, and this primary key is created without [USING HASH](#).

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available [DataMemory](#) or [IndexMemory](#) is in use, and again when use reaches 85%, 90%, and so on.

30.10.9: What filesystems can I use with MySQL Cluster? What about network filesystems or network shares?

Generally, any filesystem that is native to the host operating system should work well with MySQL Cluster. If you find that a given filesystem works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the [MySQL Cluster Forums](#).

We do not test MySQL Cluster with [FAT](#) or [VFAT](#) filesystems on Linux. Because of this, and due to the fact that these are not very useful for any purpose other than sharing disk partitions between Linux and Windows operating systems on multi-boot computers, we do not recommend their use with MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network filesystems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

30.10.10: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If the issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

30.10.11: I'm trying to populate a Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the [NDB](#) storage engine and automatically created in the event that the table definition does not include the definition of a primary key.*

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. In other words, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote only 1GB to clustering.

30.10.12: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is very unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet — preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.)

30.10.13: Do I have to learn a new programming or query language to use MySQL Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables (including Disk Data tables and related objects)
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster — see [Section 16.4.4, “Configuration File”](#), for information about these.

A few simple commands are used in the MySQL Cluster management client for tasks such as starting and stopping cluster nodes. See [Section 16.7.2, “Commands in the MySQL Cluster Management Client”](#).

30.10.14: How do I find out what an error or warning message means when using MySQL Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
- From a system shell prompt, use `pererror --ndb error_code`.

30.10.15: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes: For tables created with the [NDB](#) storage engine, transactions are supported. In MySQL 5.1, Cluster supports only the [READ COM-](#)

MITTED transaction isolation level.

30.10.16: What storage engines are supported by MySQL Cluster?

Clustering in MySQL is supported only by the **NDB** storage engine. That is, in order for a table to be shared between nodes in a cluster, it must be created using **ENGINE=NDB** (or **ENGINE=NDBCLUSTER**, which is equivalent).

It is possible to create tables using other storage engines (such as **MyISAM** or **InnoDB**) on a MySQL server being used for clustering, but these non-**NDB** tables will **not** participate in the cluster; they are local to the individual MySQL server instance on which they are created.

30.10.17: Which versions of the MySQL software support Cluster? Do I have to compile from source?

Cluster is supported in all server binaries in the 5.1 release series for operating systems on which MySQL Cluster is available. See [Section 5.2, “mysqld — The MySQL Server”](#). You can determine whether your server has NDB support using either the **SHOW VARIABLES LIKE 'have_%'** or **SHOW ENGINES** statement.

You can also obtain NDB support by compiling MySQL from source, but it is not necessary to do so simply to use MySQL Cluster. To download the latest binary, RPM, or source distribution in the MySQL 5.1 series, visit <http://dev.mysql.com/downloads/mysql/5.1.html>.

30.10.18: In the event of a catastrophic failure — say, for instance, the whole city loses power and my UPS fails — would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

30.10.19: Is it possible to use **FULLTEXT** indexes with Cluster?

FULLTEXT indexing is not supported by the **NDB** storage engine in MySQL 5.1, or by any storage engine other than **MyISAM**. We are working to add this capability in a future release.

30.10.20: Can I run multiple nodes on a single computer?

It is possible but not advisable. One of the chief reasons to run a cluster is to provide redundancy. To enjoy the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the **ndb_mgmd** and **ndb_mgm** processes.

It is acceptable to run multiple cluster data nodes on a single host for learning about MySQL Cluster, or for testing purposes; however, this is *not* supported for production use.

30.10.21: Can I add nodes to a cluster without restarting it?

Not at present. A simple restart is all that is required for adding new MGM or SQL nodes to a Cluster. When adding data nodes the process is more complex, and requires the following steps:

1. Make a complete backup of all Cluster data.
2. Completely shut down the cluster and all cluster node processes.
3. Restart the cluster, using the **--initial** startup option.

Warning

Never use the **--initial** when starting **ndbd** except when necessary to clear the data node filesystem. See [Section 16.6.5.2, “Command Options for ndbd”](#), for information about when this is required.

4. Restore all cluster data from the backup.

In a future MySQL Cluster release series, we hope to implement a “hot” reconfiguration capability for MySQL Cluster to minimize (if not eliminate) the requirement for restarting the cluster when adding new nodes. However, this is not planned for MySQL 5.1.

30.10.22: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on [NDB](#) tables in MySQL 5.1 include:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for [NDB](#) tables are [KEY](#) and [LINEAR KEY](#). (Beginning with MySQL 5.1.12, attempting to create an [NDB](#) table using any other partitioning type fails with an error.)
- [FULLTEXT](#) indexes and index prefixes are not supported. Only complete columns may be indexed.
- Spatial data types are not supported. See [Chapter 18, Spatial Extensions](#).
- Only complete rollbacks for transactions are supported. Partial rollbacks and rollbacks to save points are not supported.
- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting [BLOB](#) values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The [NDB](#) engine does not support foreign key constraints. As with [MyISAM](#) tables, these are ignored.

For a complete listing of limitations in MySQL Cluster, see [Section 16.13, “Known Limitations of MySQL Cluster”](#).

30.10.23: How do I import an existing MySQL database into a cluster?

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ and in [Section 16.13, “Known Limitations of MySQL Cluster”](#), the only other special requirement is that any tables to be included in the cluster must use the [NDB](#) storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables using other storage engines to [NDB Cluster](#) using one or more `ALTER TABLE` statement, but this requires an additional workaround. See [Section 16.13, “Known Limitations of MySQL Cluster”](#), for details.

30.10.24: How do cluster nodes communicate with one another?

Cluster nodes can communicate via any of three different protocols: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental in MySQL 5.1. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 16.12, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about using SCI as a transport mechanism in MySQL Cluster.

30.10.25: What is an arbitrator?

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbitrator comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbitrator belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the [ArbitrationRank](#) configuration parameter for MySQL Server and management server nodes. (See [Section 16.4.4.4, “Defining the Management Server”](#), for details.) It should also be noted that the role of arbitrator does not in and of itself

impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

30.10.26: What data types are supported by MySQL Cluster?

MySQL Cluster supports all of the usual MySQL data types, with the exception of those associated with MySQL's spatial extensions. (See [Chapter 18, *Spatial Extensions*](#).) In addition, there are some differences with regard to indexes when used with NDB tables. **Note:** MySQL Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 16.13, “Known Limitations of MySQL Cluster”](#), for more information about these issues.

30.10.27: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node with the `ndb_mgmd` command.
2. Start each data node with the `ndbd` command.
3. Start each MySQL server (SQL node) using `mysqld_safe --user=mysql &`.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine — a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the MGM management client `ndb_mgm` on the machine housing the MGM node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the MGM client. Alternatively, you may enter the following command in a system shell on the machine hosting the MGM node:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(Note that the quotation marks are optional here; the `SHUTDOWN` command itself is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqldadmin shutdown`.

For more information, see [Section 16.7.2, “Commands in the MySQL Cluster Management Client”](#), and [Section 16.3.6, “Safe Shut-down and Restart”](#).

30.10.28: What happens to cluster data when the cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

30.10.29: Is it helpful to have more than one management node for a cluster?

It can be helpful as a fail-safe. Only one MGM node controls the cluster at any given time, but it is possible to configure one MGM as primary, and one or more additional management nodes to take over in the event that the primary MGM node fails.

See [Section 16.4.4, “Configuration File”](#), for information on how to configure MySQL Cluster management nodes.

30.10.30: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?

Yes, so long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). It is also possible to use different MySQL Cluster releases on different nodes. However, we recommend this be done only as part of a rolling upgrade procedure (see [Section 16.5.1, “Performing a Rolling Restart of the Cluster”](#)).

30.10.31: Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, *running more than one cluster node of a given type per machine is not supported for production use.*

30.10.32: Can I use hostnames with MySQL Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional points of failure, and the fewer of these, the better.

30.10.33: How do I handle MySQL users in a Cluster having multiple MySQL servers?

MySQL user accounts and privileges are not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself.

A.11. MySQL 5.1 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- [30.11.1](#): I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- [30.11.2](#): What GB (Chinese) character sets does MySQL support?
- [30.11.3](#): What problems should I be aware of when working with the Big5 Chinese character set?
- [30.11.4](#): Why do Japanese character set conversions fail?
- [30.11.5](#): What should I do if I want to convert SJIS `81CA` to `cp932`?
- [30.11.6](#): How does MySQL represent the Yen (¥) sign?
- [30.11.7](#): Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?
- [30.11.8](#): Of what issues should I be aware when working with Korean character sets in MySQL?
- [30.11.9](#): Why do I get `DATA TRUNCATED` error messages?
- [30.11.10](#): Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- [30.11.11](#): I've upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- [30.11.12](#): Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- [30.11.13](#): What CJK character sets are available in MySQL?
- [30.11.14](#): How do I know whether character `X` is available in all character sets?
- [30.11.15](#): Why don't CJK strings sort correctly in Unicode? (I)
- [30.11.16](#): Why don't CJK strings sort correctly in Unicode? (II)
- [30.11.17](#): Why are my supplementary characters rejected by MySQL?
- [30.11.18](#): Shouldn't it be “CJKV”?
- [30.11.19](#): Does MySQL allow CJK characters to be used in database and table names?
- [30.11.20](#): Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- [30.11.21](#): Where can I get help with CJK and related issues in MySQL?

Questions and Answers

30.11.1: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column *column_name* in the table *table_name* using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible — that is, when you select *literal* (or *_introducer hexadecimal-value*), you obtain *literal* as a result.*

For example, the Japanese *Katakana* character *Pe* (`#`) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT '#' AS '#';          /* or SELECT _ucs2 0x30da; */
```

If the result is not also `#`, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('#');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.03 sec)
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it's often not what

your operating system utilities support best. Many Windows users find that a Microsoft character set, such as [cp932](#) for Japanese Windows, is what's suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in ([euckr](#) = Korea; [gb2312](#) or [gbk](#) = People's Republic of China; [big5](#) = Taiwan; [sjis](#), [ujis](#), [cp932](#), or [eucjpm](#)s = Japan; [ucs2](#) or [utf8](#) = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: [SET NAMES](#). For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing [my.cnf](#) or [my.ini](#). For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...*? for more information.

30.11.2: What GB (Chinese) character sets does MySQL support?

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*) character sets which are official in the People's Republic of China: [gb2312](#) and [gbk](#). Sometimes people try to insert [gbk](#) characters into [gb2312](#), and it works most of the time because [gbk](#) is a superset of [gb2312](#) — but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in [gb2312](#) or [gbk](#), with reference to the official documents. Please check these references before reporting [gb2312](#) or [gbk](#) bugs.

- For a complete listing of the [gb2312](#) characters, ordered according to the [gb2312_chinese_ci](#) collation: http://d.udm.net/bar/~bar/charts/gb2312_chinese_ci.html.
- MySQL's [gbk](#) is in reality “Microsoft code page 936”. This differs from the official [gbk](#) for characters [A1A4](#) (middle dot), [A1AA](#) (em dash), [A6E0-A6F5](#), and [A8BB-A8C0](#). For a listing of the differences, see <http://recode.progiels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of [gbk](#)/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of [gbk](#) characters, see http://d.udm.net/bar/~bar/charts/gbk_chinese_ci.html.

30.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's [big5](#) is in reality Microsoft code page 950, which is very similar to the original [big5](#) character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| #    |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding [HKSCS](#) extensions has been filed. People who need this extension may find the suggested patch for [Bug#13577](#) to be of interest.

30.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpm`s character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpm`s columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpm`s column.

Character Name	ucs2	sjis	cp932	ujis	eucjpm
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider this portion of the table:

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”) — this is what is always used when the conversion cannot be performed.

30.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`. We are considering a change to this behavior.

30.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

30.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 5.2.

30.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN(#)`. This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
-> CONVERT('#' USING euckr) AS euckr,
-> HEX(CONVERT('#' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?    | 3F      |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: http://d.udm.net/bar/~bar/charts/euckr_korean_ci.html.

30.11.9: Why do I get DATA TRUNCATED error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
-> (ucs2 CHAR(3) CHARACTER SET ucs2,
-> gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `#` in both columns.

```
mysql> INSERT INTO ch VALUES ('A#B', 'A#B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there's a warning. Let's see what it is.

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it's a warning about the `gb2312` column only.

```
mysql> SELECT ucs2, HEX(ucs2), gb2312, HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A#B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it's a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `#` character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

30.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or

another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 26.1.3, “Connector/ODBC Configuration”](#). If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 26.2.5.1, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);
mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 26.4.4.4, “Using Character Sets and Unicode”](#).

30.11.11: I’ve upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set

that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

30.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `#` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '#') |
+-----+-----+
| 1 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list,

which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

30.11.13: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the [eucjpms](#) character set was not supported prior to MySQL 5.0.3. However, since the name of the applicable language appears in the [DESCRIPTION](#) column for every entry in the [INFORMATION_SCHEMA.CHARACTER_SETS](#) table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
eucjpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

8 rows in set (0.01 sec)

(See [Section 23.9](#), “[The INFORMATION_SCHEMA.CHARACTER_SETS Table](#)”, for more information.)

30.11.14: How do I know whether character *X* is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a [UCS-2](#) Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
  CREATE TABLE tj
  (ucs2 CHAR(1) character set ucs2,
   utf8 CHAR(1) character set utf8,
   big5 CHAR(1) character set big5,
   cp932 CHAR(1) character set cp932,
   eucjpms CHAR(1) character set eucjpms,
   euckr CHAR(1) character set euckr,
   gb2312 CHAR(1) character set gb2312,
   gbk CHAR(1) character set gbk,
   sjis CHAR(1) character set sjis,
   ujis CHAR(1) character set ujis);

  INSERT INTO tj (ucs2) VALUES (ucs2_char);

  UPDATE tj SET utf8=ucs2,
               big5=ucs2,
               cp932=ucs2,
               eucjpms=ucs2,
               euckr=ucs2,
               gb2312=ucs2,
               gbk=ucs2,
               sjis=ucs2,
               ujis=ucs2;

  /* If there's a conversion problem, UPDATE will produce a warning. */

  SELECT hex(ucs2) AS ucs2,
         hex(utf8) AS utf8,
         hex(big5) AS big5,
         hex(cp932) AS cp932,
         hex(eucjpms) AS eucjpms,
         hex(euckr) AS euckr,
         hex(gb2312) AS gb2312,
         hex(gbk) AS gbk,
         hex(sjis) AS sjis,
         hex(ujis) AS ujis
  FROM tj;

  DROP TABLE tj;

END//
```

The input can be any single [ucs2](#) character, or it can be the code point value (hexadecimal representation) of that character. For ex-

ample, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)
```

Since none of the column values is `3F` — that is, the question mark character (?) — we know that every conversion worked.

30.11.15: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCD/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the [uniconcode.org](http://www.unicode.org) home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```
mysql> CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('#'),('#');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = '#';
+-----+
| s1 |
+-----+
| # |
| # |
+-----+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| # | 304C |
| # | 304B |
+-----+-----+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (*KA* or *GA*, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `#` and `#` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_unicode_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like *KA/GA* are distinguishable for ordering purposes.

30.11.16: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.1 FAQ — MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
```

```
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2               | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 23.3, “The INFORMATION_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   | 2      |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

30.11.17: Why are my supplementary characters rejected by MySQL?

MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

We intend at some point in the future to add support for `UTF-16`, which would solve such issues by allowing 4-byte characters. However, we have as yet set no definite timetable for doing so.

30.11.18: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

30.11.19: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named `#` on a server whose operating system does not support CJK in directory names, MySQL creates a directory named `@0w@00a5@00ae.` which is just a fancy way of encoding `E6A5AE` — that is, the Unicode hexadecimal representation for the `#` character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as `#`.

30.11.20: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/#chinese-5.1>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/#japanese-4.1>.

30.11.21: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets](#), [Collation](#), [Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

A.12. MySQL 5.1 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 25.2.14, “Common Questions and Problems When Using the C API”](#)
- [Section 25.3.1, “Common Problems with MySQL and PHP”](#)
- [Section 26.1.6, “Connector/ODBC Notes and Tips”](#)
- [Section 26.2.5, “Connector/NET Notes and Tips”](#)
- [Section 26.4.5, “Connector/J Notes and Tips”](#)
- [Section 26.5.5, “Connector/MXJ Notes and Tips”](#)

A.13. MySQL 5.1 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 15.3.4, “Replication FAQ”](#).

A.14. MySQL 5.1 FAQ — MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- [30.14.1.1: What is DRBD?](#)
- [30.14.1.2: What are “Block Devices”?](#)
- [30.14.1.3: How is DRBD licensed?](#)
- [30.14.1.4: Where can I download DRBD?](#)
- [30.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?](#)
- [30.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?](#)

Questions and Answers

30.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages

synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

30.14.1.2: What are “Block Devices”?

Block devices are the type of device used to represent storage in the Linux Kernel. All physical disk devices present a “block device” interface. Additionally, virtual disk systems like LVM or DRBD present a “block device” interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

30.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

30.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download.html>

30.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see: <http://lists.linbit.com/> .

30.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit: <http://mysql.com/drbd/>

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- [30.14.2.1](#): What is Linux Heartbeat?
- [30.14.2.2](#): How is Linux Heartbeat licensed?
- [30.14.2.3](#): Where can I download Linux Heartbeat?
- [30.14.2.4](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

30.14.2.1: What is Linux Heartbeat?

The Linux-HA project (<http://www.linux-ha.org/>) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

30.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

30.14.2.3: Where can I download Linux Heartbeat?

Please see <http://linux-ha.org/download/index.html>.

30.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- [30.14.3.1](#): Is an Active/Active option available for MySQL with DRBD?
- [30.14.3.2](#): What MySQL storage engines are supported with DRBD?
- [30.14.3.3](#): How long does a failover take?
- [30.14.3.4](#): How long does it take to resynchronize data after a failure?

Questions and Answers

30.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

30.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

30.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

30.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- [30.14.4.1](#): What is the difference between MySQL Cluster and DRBD?
- [30.14.4.2](#): What is the difference between MySQL Replication and DRBD?
- [30.14.4.3](#): How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

30.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability, Scalability, and DRBD](#).

30.14.4.2: What is the difference between MySQL Replication and DRBD?

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability, Scalability, and DRBD](#).

30.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server, shown in [Figure A.1, “Active-Master MySQL server”](#). Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL server

A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- [30.14.5.1: Can XFS be used with DRBD?](#)

Questions and Answers

30.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- [30.14.6.1](#): Can I use DRBD on top of LVM?
- [30.14.6.2](#): Can I use LVM on top of DRBD?
- [30.14.6.3](#): Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

30.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

30.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

30.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- [30.14.7.1](#): Can I use DRBD with OpenVZ?
- [30.14.7.2](#): Can I use DRBD with Xen and/or KVM?

Questions and Answers

30.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

30.14.7.2: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- [30.14.8.1](#): Can I encrypt/compress the exchanged data?

- [30.14.8.2](#): Does DRBD do mutual node authentication?

Questions and Answers

30.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

30.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- [30.14.9.1](#): What other packages besides DRBD are required?
- [30.14.9.2](#): How many machines are required to set up DRBD?
- [30.14.9.3](#): Does DRBD only run on Linux?

Questions and Answers

30.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for [glibc](#) and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

30.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

30.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DBRD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- [30.14.10.1](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [30.14.10.2](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?
- [30.14.10.3](#): Are pre-built binaries or RPMs available?
- [30.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [30.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [30.14.10.6](#): Where can I get more information about MySQL for DRBD?

Questions and Answers

30.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

30.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD and Linux Heartbeat is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

Note

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HP-UX, AIX, FreeBSD, or other non-Linux platforms.

30.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information see: <http://mysql.com/products/enterprise/features.html>.

30.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

Coming soon.

30.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, <http://forums.mysql.com/list.php?144>.

30.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: [DRBD for MySQL High Availability](#).

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

MySQL Enterprise

The MySQL Enterprise Monitor provides a “Virtual DBA” to assist with problem solving. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as [glibc](#)) are up to date.

It's always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.11, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it's time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it's always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.1.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.7.8, “Causes of Access denied Errors”](#), and [Section 5.7.2, “How the Privilege System Works”](#).

B.1.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the filesystem (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a hostname or if you specify the special hostname `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a hostname when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the hostname.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket filename or TCP/IP port number when trying to connect to the server.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, the network port you specified is the one configured on the server, and that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket filename might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=socket --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current hostname) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the hostname of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section B.1.2.2.1, "Connection to MySQL Server Failing on Windows"](#).
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1.1, "Operating Systems Supported by MySQL Community Server"](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the hostname explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket pathname for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket filename in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- Make sure that your `mysqld` server was not started with the `--skip-networking` option. If it was, you cannot connect to it using TCP/IP.
- Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default).

Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked.

Under Windows, applications such as ZoneAlarm and the Windows XP personal firewall may need to be configured to allow external access to a MySQL server.

- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.1.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.1.2.3. Client does not support authentication protocol

MySQL 5.1 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD( )` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD( )` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.7.9, “Password Hashing as of MySQL 4.1”](#).

B.1.2.4. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
```

```
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.1.2.5. Host '*host_name*' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '*host_name*' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.2.3, “System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.1.2.6. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Beginning with MySQL 5.1.15, its default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should restart `mysqld` with a larger value for this variable.

MySQL Enterprise

Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information see, <http://www.mysql.com/products/enterprise/advisors.html>.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.5.4.25, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by MySQL AB can support up to 4000 connections.

B.1.2.7. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.1.2.8. MySQL server has gone away

This section also covers the related [Lost connection to server during query](#) error.

The most common reason for the [MySQL server has gone away](#) error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent):

Error Code	Description
CR_SERVER_GONE_ERROR	The client couldn't send a question to the server.
CR_SERVER_LOST	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the [wait_timeout](#) variable when you start `mysqld`. See [Section 5.2.3, “System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the [MySQL server has gone away](#) error are:

- You (or the db administrator) has killed the running thread with a [KILL](#) statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT, ...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT, ...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the [reconnect](#) flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because [wait_timeout](#) expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.1.8, even if the [reconnect](#) flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a [mysql_ping](#) on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set [wait_timeout](#) on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big [BLOB](#) columns), you can increase the query limit by setting the server's [max_allowed_packet](#) variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.1.2.9, “Packet too large”](#).

An [INSERT](#) or [REPLACE](#) statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per [INSERT](#) or [REPLACE](#).

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if hostname lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the [MySQL server has gone away](#) error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's up-time. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.11.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the `--log` option to determine whether the problem query appears in the log?

See also [Section B.1.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.2.9. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.1 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a **Packet too large** error and closes the connection. With some clients, you may also get a **Lost connection to MySQL server during query** error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big **BLOB** columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]  
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.1.2.10. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.11.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If `Aborted connections` messages appear in the error log, the cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.2.3, “System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

When any of these things happen, the server increments the `Aborted_clients` status variable.

The server increments the `Aborted_connects` status variable when the following things happen:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.2.3, “System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server!

MySQL Enterprise

For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connections` status variable. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.1.2.9, “Packet too large”](#).

See also [Section B.1.2.8, “MySQL server has gone away”](#).

B.1.2.11. The table is full

The maximum effective table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 filesystem) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS filesystem	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 filesystem. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.5.7, “Adding and Removing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is allowed by the internal pointer size. [MyISAM](#) creates tables to allow up to 256GB by default, but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG_ROW_LENGTH](#) and [MAX_ROWS](#) options. See [Section 12.1.10, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum allowable size. See [Section 12.1.4, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG_ROW_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam_data_pointer_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX_ROWS](#) option. The value of [myisam_data_pointer_size](#) can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`. See [Section 12.5.4, “SHOW Syntax”](#), or [Section 7.5, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for **MyISAM** tables are as follows:

- If your large table is read-only, you can use `myisampack` to compress it. `myisampack` usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See [Section 7.7, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a **MERGE** library that allows you to handle a collection of **MyISAM** tables that have identical structure as a single **MERGE** table. See [Section 13.6, “The MERGE Storage Engine”](#).
- You are using the **NDB** storage engine, in which case you need to increase the values for the **DataMemory** and **IndexMemory** configuration parameters in your `config.ini` file. See [Section 16.4.5.1, “Data Node Configuration Parameters”](#).
- You are using the **MEMORY (HEAP)** storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See [Section 5.2.3, “System Variables”](#).

B.1.2.12. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '...\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]  
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the filesystem is full:

```
shell> pererror 28  
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the filesystem and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.1.2.13. Commands out of sync

If you get **Commands out of sync; you can't run this command now** in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.1.2.14. Ignoring user

If you get the following error, it means that when `mysql` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

Found wrong password for user 'some_user'@'some_host'; ignoring user

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysql` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long) and you didn't start `mysql` with the `--old-protocol` option. Update the account in the `user` table to have a new password or restart `mysql` with the `--old-protocol` option.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

B.1.2.15. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a filesystem that has case-sensitive filenames.
- Even for filesystems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.5.4, “SHOW Syntax”](#).

B.1.2.16. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to re-compile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.9.2, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-character-sets=complex`, which enables support for all multi-byte character sets. See [Section 5.10.1, “The Character Set Used for Data and Sorting”](#).

- The character set is a simple character set that is not compiled into `mysql`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.2, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.1.2.17. '**FILE**' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or (as of MySQL 3.23.30) set the `open_files_limit` system variable. See [Section 5.2.3, “System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.1.3. Installation-Related Issues

B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the pathname of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.9, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for `UMASK` and `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.14, “Environment Variables”](#).

B.1.4. Administration-Related Issues

B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it

is recommended to set a password for each account. See [Section 5.6.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The following procedure is for Windows systems. The procedure for Unix systems is given later in this section.

The procedure under Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `C:\mysql-init.txt`.

4. Open a console window to get to the DOS command prompt:

```
Start Menu -> Run -> cmd
```

5. We are assuming that you installed MySQL to `C:\mysql`. If you installed MySQL to another location, adjust the following commands accordingly.

At the DOS command prompt, execute this command:

```
C:\> C:\mysql\bin\mysqld-nt --init-file=C:\mysql-init.txt
```

The contents of the file named by the `--init-file` option are executed at server startup, changing the `root` password. After the server has started successfully, you should delete `C:\mysql-init.txt`.

If you install MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld-nt.exe"  
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.1\my.ini"  
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the [Properties](#) option. The [Path to executable](#) field contains the `--defaults-file` setting.

6. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.
7. You should be able to connect using the new password.

In a Unix environment, the procedure for resetting the `root` password is as follows:

MySQL Enterprise

For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

1. Log on to your system as either the Unix `root` user or as the same user that the `mysqld` server runs as.

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, hostname, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the filename has the extension of `.pid` and begins with either `mysqld` or your system's hostname.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the pathname of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `~/mysql-init`.

4. Restart the MySQL server with the special `--init-file=~/mysql-init` option:

```
shell> mysqld_safe --init-file=~/mysql-init &
```

The contents of the init-file are executed at server startup, changing the root password. After the server has started successfully you should delete `~/mysql-init`.

5. You should be able to connect using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables --user=root` options (Windows users omit the `--user=root` portion).
2. Connect to the `mysqld` server with this command:

```
shell> mysql -u root
```

3. Issue the following statements in the `mysql` client:

```
mysql> UPDATE mysql.user SET Password=PASSWORD('newpwd')  
-> WHERE User='root';  
mysql> FLUSH PRIVILEGES;
```

Replace “*newpwd*” with the actual `root` password that you want to use.

4. You should be able to connect using the new password.

B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.11.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `re-solve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `-delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good filesystem locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it's at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, Database Administration](#).
- Start `mysqld` with the `--log` option and try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.11.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.8, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 28.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.

- Try the following:

1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
2. Run your test scripts.
3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.8, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use at MySQL AB for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to both RAMS and hard-drives when troubleshooting hardware.

B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these

operations, it removes the big temporary files and mark the table as crashed. The exception is that for **ALTER TABLE**, the old table is left unchanged.

MySQL Enterprise

For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the **TMPDIR** environment variable as the pathname of the directory in which to store temporary files. If you don't have **TMPDIR** set, MySQL uses the system default, which is normally **/tmp**, **/var/tmp**, or **/usr/tmp**. If the filesystem containing your temporary file directory is too small, you can use the **--tmpdir** option to **mysqld** to specify a directory in a filesystem where you have enough space.

In MySQL 5.1, the **--tmpdir** option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (':') on Unix and semicolon characters(';') on Windows, NetWare, and OS/2. **Note:** To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set **--tmpdir** to point to a directory on a memory-based filesystem or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or **LOAD DATA INFILE** operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if **mysqld** is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the filesystem in which the temporary file directory is located.

MySQL Enterprise

Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information see, <http://www.mysql.com/products/enterprise/advisors.html>.

When sorting (**ORDER BY** or **GROUP BY**), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some **SELECT** queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form **SQL_***.

ALTER TABLE creates a temporary table in the same directory as the original table.

B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is **/tmp/mysql.sock**. (For some distribution formats, the directory might be different, such as **/var/lib/mysql** for RPMs.)

On some versions of Unix, anyone can delete files in the **/tmp** directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your **/tmp** directory so that files can be deleted only by their owners or the superuser (**root**). To do this, set the **sticky** bit on the **/tmp** directory by logging in as **root** and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the **sticky** bit is set by executing **ls -ld /tmp**. If the last permission character is **t**, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in **/etc/my.cnf**:

```
[mysqld]
```

```
socket=/path/to/socket
[client]
socket=/path/to/socket
```

See [Section 4.3.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See [Section 2.9.2, “Typical configure Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 2.14, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.1.5. Query-Related Issues

B.1.5.1. Case Sensitivity in Searches

By default, MySQL searches are not case sensitive (although there are some character sets that are never case insensitive, such as `czech`). This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. If you want to make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation. For example:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.10, “CREATE TABLE Syntax”](#).

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value (such as `‘E’`, `‘e’`, and `‘Ä#Â@’`) are treated as the same character.

B.1.5.2. Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as

'20040815'), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date '0000-00-00' can be stored and retrieved as '0000-00-00'. When using a '0000-00-00' date through MySQL ODBC, it is automatically converted to `NULL` in MySQL ODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store '0000-00-00' as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a 0 is stored in the `DATE` column, which is retrieved as '0000-00-00'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to "NO_ZERO_IN_DATE, NO_ZERO_DATE".

B.1.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.5, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.5.4.28, “SHOW TABLE STATUS Syntax”](#), and [Section 12.5.4.9, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.5.4.14, “SHOW ENGINES Syntax”](#), and [Section 12.5.4.31, “SHOW VARIABLES Syntax”](#).

MySQL Enterprise

Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 6.2.1, “Optimizing Queries with EXPLAIN”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it's a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some

cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.1.5.8, “Problems with Floating-Point Comparisons”](#).

- If you still can't figure out what's wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such. For `DECIMAL` columns, MySQL performs operations with a precision of 64 decimal digits, which should solve most common inaccuracy problems.

The following example demonstrates the problem using `DOUBLE`. It shows that are calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row — the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

i	a	b
6	-51.4	0

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
```

```
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2

5 rows in set (0.03 sec)

B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the **EXPLAIN** statement to get information about how MySQL processes a query. To use it, just add the keyword **EXPLAIN** to the front of your **SELECT** statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

EXPLAIN is discussed in more detail in [Section 6.2.1, “Optimizing Queries with EXPLAIN”](#).

- Use **ANALYZE TABLE *tbl_name*** to update the key distributions for the scanned table. See [Section 12.5.2.1, “ANALYZE TABLE Syntax”](#).
- Use **FORCE INDEX** for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

USE INDEX and **IGNORE INDEX** may also be useful. See [Section 12.2.7.2, “Index Hint Syntax”](#).

- Global and table-level **STRAIGHT_JOIN**. See [Section 12.2.7, “SELECT Syntax”](#).
- You can tune global or thread-specific system variables. For example, Start **mysqld** with the **--max-seeks-for-key=1000** option or use **SET max_seeks_for_key=1000** to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.2.3, “System Variables”](#).

MySQL Enterprise

B.1.7. Table Definition-Related Issues

B.1.7.1. Problems with **ALTER TABLE**

ALTER TABLE changes a table to the current character set. If you get a duplicate-key error during **ALTER TABLE**, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run **REPAIR TABLE** on the table.

If **ALTER TABLE** dies with the following error, the problem may be that MySQL crashed during an earlier **ALTER TABLE** operation and there is an old table named **A-xxx** or **B-xxx** lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with **A-** or **B-**. (You may want to move them elsewhere instead of deleting them.)

ALTER TABLE works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

B.1.7.3. TEMPORARY TABLE Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.

- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 15.3.1, “Replication Features and Issues”](#), for more information.

B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.13, “Operating System-Specific Notes”](#), and [MySQL Internals: Porting](#).

B.1.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- MySQL Cluster fails to recover from an out-of-disk failure when using disk data. ([Bug#17614](#))
- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no **ORDER BY** clause guaranteeing a deterministic order.

For example, for **INSERT ... SELECT** with no **ORDER BY**, the **SELECT** may return rows in a different order (which results in a row having different ranks, hence getting a different number in the **AUTO_INCREMENT** column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use **InnoDB** on the master, but **MyISAM** on the slave if the slave has less available disk space.)
- MySQL buffer sizes (**key_buffer_size**, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using **mysqlbinlog|mysql**.

The easiest way to avoid this problem is to add an **ORDER BY** clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an **ORDER BY** clause when needed.

The following issues are known and will be fixed in due time:

- Log filenames are based on the server hostname (if you don't specify a filename with the startup option). You have to use options such as **--log-bin=old_host_name-bin** if you change your hostname to something else. Another option is to rename the old files to reflect your hostname change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.2.2, “Command Options”](#).
- **mysqlbinlog** does not delete temporary files left after a **LOAD DATA INFILE** command. See [Section 7.11, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- **RENAME** doesn't work with **TEMPORARY** tables or tables used in a **MERGE** table.
- Due to the way table format (**.frm**) files are stored, you cannot use character 255 (**CHAR(255)**) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using **SET CHARACTER SET**, you can't use translated characters in database, table, and column names.
- You can't use **'_'** or **'%'** with **ESCAPE** in **LIKE ... ESCAPE**.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.9.5, “MIT-pthreads Notes”](#).
- **BLOB** and **TEXT** values can't reliably be used in **GROUP BY**, **ORDER BY** or **DISTINCT**. Only the first **max_sort_length** bytes are used when comparing **BLOB** values in these cases. The default value of **max_sort_length** is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with **BIGINT** or **DOUBLE** (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with **BIGINT** precision, **IF** and **ELT()** with **BIGINT** or **DOUBLE** precision, and the rest with **DOUBLE** precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 **ENUM** and **SET** columns in one table.
- In **MIN()**, **MAX()**, and other aggregate functions, MySQL currently compares **ENUM** and **SET** columns by their string value rather than by the string's relative position in the set.
- **mysqld_safe** redirects all messages from **mysqld** to the **mysqld** log. One problem with this is that if you execute **mysqldadmin refresh** to close and reopen the log, **stdout** and **stderr** are still redirected to the old log. If you use **--log** extensively, you should edit **mysqld_safe** to log to **host_name.err** instead of **host_name.log** so that you can easily reclaim the space for the old log by deleting it and executing **mysqldadmin refresh**.

- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not** 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

B.2. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error value (**1146**). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the [share/errmsg.txt](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in [share/errmsg.txt](#) are used to generate the definitions in the [include/mysql_error.h](#) and [include/mysql_ename.h](#) MySQL source files.
- The SQLSTATE values listed in [share/errmsg.txt](#) are used to generate the definitions in the [include/sql_state.h](#) MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [1000](#) SQLSTATE: [HY000](#) ([ER_HASHCHK](#))
Message: hashchk
- Error: [1001](#) SQLSTATE: [HY000](#) ([ER_NISAMCHK](#))
Message: isamchk
- Error: [1002](#) SQLSTATE: [HY000](#) ([ER_NO](#))
Message: NO
- Error: [1003](#) SQLSTATE: [HY000](#) ([ER_YES](#))
Message: YES
- Error: [1004](#) SQLSTATE: [HY000](#) ([ER_CANT_CREATE_FILE](#))
Message: Can't create file '%s' (errno: %d)
- Error: [1005](#) SQLSTATE: [HY000](#) ([ER_CANT_CREATE_TABLE](#))
Message: Can't create table '%s' (errno: %d)
- Error: [1006](#) SQLSTATE: [HY000](#) ([ER_CANT_CREATE_DB](#))
Message: Can't create database '%s' (errno: %d)
- Error: [1007](#) SQLSTATE: [HY000](#) ([ER_DB_CREATE_EXISTS](#))
Message: Can't create database '%s'; database exists
- Error: [1008](#) SQLSTATE: [HY000](#) ([ER_DB_DROP_EXISTS](#))
Message: Can't drop database '%s'; database doesn't exist
- Error: [1009](#) SQLSTATE: [HY000](#) ([ER_DB_DROP_DELETE](#))
Message: Error dropping database (can't delete '%s', errno: %d)
- Error: [1010](#) SQLSTATE: [HY000](#) ([ER_DB_DROP_RMDIR](#))
Message: Error dropping database (can't rmdir '%s', errno: %d)
- Error: [1011](#) SQLSTATE: [HY000](#) ([ER_CANT_DELETE_FILE](#))
Message: Error on delete of '%s' (errno: %d)
- Error: [1012](#) SQLSTATE: [HY000](#) ([ER_CANT_FIND_SYSTEM_REC](#))
Message: Can't read record in system table
- Error: [1013](#) SQLSTATE: [HY000](#) ([ER_CANT_GET_STAT](#))

Message: Can't get status of '%s' (errno: %d)

- Error: [1014](#) SQLSTATE: [HY000](#) ([ER_CANT_GET_WD](#))

Message: Can't get working directory (errno: %d)

- Error: [1015](#) SQLSTATE: [HY000](#) ([ER_CANT_LOCK](#))

Message: Can't lock file (errno: %d)

- Error: [1016](#) SQLSTATE: [HY000](#) ([ER_CANT_OPEN_FILE](#))

Message: Can't open file: '%s' (errno: %d)

- Error: [1017](#) SQLSTATE: [HY000](#) ([ER_FILE_NOT_FOUND](#))

Message: Can't find file: '%s' (errno: %d)

- Error: [1018](#) SQLSTATE: [HY000](#) ([ER_CANT_READ_DIR](#))

Message: Can't read dir of '%s' (errno: %d)

- Error: [1019](#) SQLSTATE: [HY000](#) ([ER_CANT_SET_WD](#))

Message: Can't change dir to '%s' (errno: %d)

- Error: [1020](#) SQLSTATE: [HY000](#) ([ER_CHECKREAD](#))

Message: Record has changed since last read in table '%s'

- Error: [1021](#) SQLSTATE: [HY000](#) ([ER_DISK_FULL](#))

Message: Disk full (%s); waiting for someone to free some space...

- Error: [1022](#) SQLSTATE: [23000](#) ([ER_DUP_KEY](#))

Message: Can't write; duplicate key in table '%s'

- Error: [1023](#) SQLSTATE: [HY000](#) ([ER_ERROR_ON_CLOSE](#))

Message: Error on close of '%s' (errno: %d)

- Error: [1024](#) SQLSTATE: [HY000](#) ([ER_ERROR_ON_READ](#))

Message: Error reading file '%s' (errno: %d)

- Error: [1025](#) SQLSTATE: [HY000](#) ([ER_ERROR_ON_RENAME](#))

Message: Error on rename of '%s' to '%s' (errno: %d)

- Error: [1026](#) SQLSTATE: [HY000](#) ([ER_ERROR_ON_WRITE](#))

Message: Error writing file '%s' (errno: %d)

- Error: [1027](#) SQLSTATE: [HY000](#) ([ER_FILE_USED](#))

Message: '%s' is locked against change

- Error: [1028](#) SQLSTATE: [HY000](#) ([ER_FILSORT_ABORT](#))

Message: Sort aborted

- Error: [1029](#) SQLSTATE: [HY000](#) ([ER_FORM_NOT_FOUND](#))

Message: View '%s' doesn't exist for '%s'

- Error: **1030** SQLSTATE: **HY000** (**ER_GET_ERRNO**)
Message: Got error %d from storage engine
- Error: **1031** SQLSTATE: **HY000** (**ER_ILLEGAL HA**)
Message: Table storage engine for '%s' doesn't have this option
- Error: **1032** SQLSTATE: **HY000** (**ER_KEY_NOT_FOUND**)
Message: Can't find record in '%s'
- Error: **1033** SQLSTATE: **HY000** (**ER_NOT_FORM_FILE**)
Message: Incorrect information in file: '%s'
- Error: **1034** SQLSTATE: **HY000** (**ER_NOT_KEYFILE**)
Message: Incorrect key file for table '%s'; try to repair it
- Error: **1035** SQLSTATE: **HY000** (**ER_OLD_KEYFILE**)
Message: Old key file for table '%s'; repair it!
- Error: **1036** SQLSTATE: **HY000** (**ER_OPEN_AS_READONLY**)
Message: Table '%s' is read only
- Error: **1037** SQLSTATE: **HY001** (**ER_OUTOFMEMORY**)
Message: Out of memory; restart server and try again (needed %d bytes)
- Error: **1038** SQLSTATE: **HY001** (**ER_OUT_OF_SORTMEMORY**)
Message: Out of sort memory; increase server sort buffer size
- Error: **1039** SQLSTATE: **HY000** (**ER_UNEXPECTED_EOF**)

B.3. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errmsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. [%d](#) and [%s](#) represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000](#) ([CR_UNKNOWN_ERROR](#))
Message: Unknown MySQL error
- Error: [2001](#) ([CR_SOCKET_CREATE_ERROR](#))
Message: Can't create UNIX socket (%d)
- Error: [2002](#) ([CR_CONNECTION_ERROR](#))
Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: [2003 \(CR_CONN_HOST_ERROR\)](#)
Message: Can't connect to MySQL server on '%s' (%d)
- Error: [2004 \(CR_IPSOCK_ERROR\)](#)
Message: Can't create TCP/IP socket (%d)
- Error: [2005 \(CR_UNKNOWN_HOST\)](#)
Message: Unknown MySQL server host '%s' (%d)
- Error: [2006 \(CR_SERVER_GONE_ERROR\)](#)
Message: MySQL server has gone away
- Error: [2007 \(CR_VERSION_ERROR\)](#)
Message: Protocol mismatch; server version = %d, client version = %d
- Error: [2008 \(CR_OUT_OF_MEMORY\)](#)
Message: MySQL client ran out of memory
- Error: [2009 \(CR_WRONG_HOST_INFO\)](#)
Message: Wrong host info
- Error: [2010 \(CR_LOCALHOST_CONNECTION\)](#)
Message: Localhost via UNIX socket
- Error: [2011 \(CR_TCP_CONNECTION\)](#)
Message: %s via TCP/IP
- Error: [2012 \(CR_SERVER_HANDSHAKE_ERR\)](#)
Message: Error in server handshake
- Error: [2013 \(CR_SERVER_LOST\)](#)
Message: Lost connection to MySQL server during query
- Error: [2014 \(CR_COMMANDS_OUT_OF_SYNC\)](#)
Message: Commands out of sync; you can't run this command now
- Error: [2015 \(CR_NAMEDPIPE_CONNECTION\)](#)
Message: Named pipe: %s
- Error: [2016 \(CR_NAMEDPIPEWAIT_ERROR\)](#)
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: [2017 \(CR_NAMEDPIPEOPEN_ERROR\)](#)
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: [2018 \(CR_NAMEDPIPESETSTATE_ERROR\)](#)
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: [2019 \(CR_CANT_READ_CHARSET\)](#)
Message: Can't initialize character set %s (path: %s)

- Error: [2020 \(CR_NET_PACKET_TOO_LARGE\)](#)
Message: Got packet bigger than 'max_allowed_packet' bytes
- Error: [2021 \(CR_EMBEDDED_CONNECTION\)](#)
Message: Embedded server
- Error: [2022 \(CR_PROBE_SLAVE_STATUS\)](#)
Message: Error on SHOW SLAVE STATUS:
- Error: [2023 \(CR_PROBE_SLAVE_HOSTS\)](#)
Message: Error on SHOW SLAVE HOSTS:
- Error: [2024 \(CR_PROBE_SLAVE_CONNECT\)](#)
Message: Error connecting to slave:
- Error: [2025 \(CR_PROBE_MASTER_CONNECT\)](#)
Message: Error connecting to master:
- Error: [2026 \(CR_SSL_CONNECTION_ERROR\)](#)
Message: SSL connection error
- Error: [2027 \(CR_MALFORMED_PACKET\)](#)
Message: Malformed packet
- Error: [2028 \(CR_WRONG_LICENSE\)](#)
Message: This client library is licensed only for use with MySQL servers having '%s' license
- Error: [2029 \(CR_NULL_POINTER\)](#)
Message: Invalid use of null pointer
- Error: [2030 \(CR_NO_PREPARE_STMT\)](#)
Message: Statement not prepared
- Error: [2031 \(CR_PARAMS_NOT_BOUND\)](#)
Message: No data supplied for parameters in prepared statement
- Error: [2032 \(CR_DATA_TRUNCATED\)](#)
Message: Data truncated
- Error: [2033 \(CR_NO_PARAMETERS_EXISTS\)](#)
Message: No parameters exist in the statement
- Error: [2034 \(CR_INVALID_PARAMETER_NO\)](#)
Message: Invalid parameter number
- Error: [2035 \(CR_INVALID_BUFFER_USE\)](#)
Message: Can't send long data for non-string/non-binary data types (parameter: %d)
- Error: [2036 \(CR_UNSUPPORTED_PARAM_TYPE\)](#)
Message: Using unsupported buffer type: %d (parameter: %d)

- Error: [2037 \(CR_SHARED_MEMORY_CONNECTION\)](#)
Message: Shared memory: %s
- Error: [2038 \(CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR\)](#)
Message: Can't open shared memory; client could not create request event (%lu)
- Error: [2039 \(CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR\)](#)
Message: Can't open shared memory; no answer event received from server (%lu)
- Error: [2040 \(CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR\)](#)
Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error: [2041 \(CR_SHARED_MEMORY_CONNECT_MAP_ERROR\)](#)
Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error: [2042 \(CR_SHARED_MEMORY_FILE_MAP_ERROR\)](#)
Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error: [2043 \(CR_SHARED_MEMORY_MAP_ERROR\)](#)
Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error: [2044 \(CR_SHARED_MEMORY_EVENT_ERROR\)](#)
Message: Can't open shared memory; client could not create %s event (%lu)
- Error: [2045 \(CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR\)](#)
Message: Can't open shared memory; no answer from server (%lu)
- Error: [2046 \(CR_SHARED_MEMORY_CONNECT_SET_ERROR\)](#)
Message: Can't open shared memory; cannot send request event to server (%lu)
- Error: [2047 \(CR_CONN_UNKNOW_PROTOCOL\)](#)
Message: Wrong or unknown protocol
- Error: [2048 \(CR_INVALID_CONN_HANDLE\)](#)
Message: Invalid connection handle
- Error: [2049 \(CR_SECURE_AUTH\)](#)
Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)
- Error: [2050 \(CR_FETCH_CANCELED\)](#)
Message: Row retrieval was canceled by mysql_stmt_close() call
- Error: [2051 \(CR_NO_DATA\)](#)
Message: Attempt to read column without prior row fetch
- Error: [2052 \(CR_NO_STMT_METADATA\)](#)
Message: Prepared statement contains no metadata
- Error: [2053 \(CR_NO_RESULT_SET\)](#)
Message: Attempt to read a row while there is no result set associated with the statement

- Error: [2054 \(CR_NOT_IMPLEMENTED\)](#)
Message: This feature is not implemented yet
- Error: [2055 \(CR_SERVER_LOST_EXTENDED\)](#)
Message: Lost connection to MySQL server at '%s', system error: %d
- Error: [2056 \(CR_STMT_CLOSED\)](#)
Message: Statement closed indirectly because of a preceeding %s() call

Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.1, which is currently MySQL 5.1.21-beta. Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.1 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last BitKeeper ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

C.1. Changes in release 5.1.x (Development)

An overview of which features were added in MySQL 5.1 can be found here: [Section 1.6.1, “What's New in MySQL 5.1”](#).

For a full list of changes, please refer to the changelog sections for each individual 5.1.x release.

C.1.1. Changes in release 5.1.23 (Not yet released)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Functionality added or changed:

- If a **MyISAM** table is created with no **DATA DIRECTORY** option, the **.MYD** file is created in the database directory. By default, if **MyISAM** finds an existing **.MYD** file in this case, it overwrites it. The same applies to **.MYI** files for tables created with no **INDEX DIRECTORY** option. To suppress this behavior, start the server with the new **--keep_files_on_create** option, in which case **MyISAM** will not overwrite existing files and returns an error instead. ([Bug#29325](#))

Bugs fixed:

- **STR_TO_DATE()** displayed an error message that referred to **STR_TO_TIME()**. ([Bug#27014](#))
- **mysql_upgrade** could run binaries dynamically linked against incorrect versions of shared libraries. ([Bug#28560](#))
- MySQL failed to generate or retrieve an **AUTO_INCREMENT** primary key for **InnoDB** tables with user-defined partitioning. ([Bug#27405](#))
- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. ([Bug#30269](#))
- Using **HANDLER** to open a table having a storage engine not supported by **HANDLER** properly returned an error, but also improperly prevented the table from being dropped by other connections. ([Bug#25856](#))

- Statements within stored procedures ignored the value of the `low_priority_updates` system variable. (Bug#28570)
- When `mysqlslap` was given a query to execute from a file via a `--query=file_name` option, it executed the query one too many times. (Bug#29803)
- A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. (Bug#27352)
- Some character mappings in the `ascii.xml` file were incorrect. (Bug#27562)
- Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not allowed by the user's access privileges. (Bug#27629)
- If a `LIMIT` clause was present, the server could fail to consider indexes that could be used for `ORDER BY` or `GROUP BY`. (Bug#28404)
- `mysqlbinlog` produced incorrectly formatted `DATETIME` and `TIMESTAMP` values. (Bug#27894)
- `GROUP BY` on `BIT` columns produced incorrect results. (Bug#30219)

C.1.2. Changes in release 5.1.22 (Not yet released)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Functionality added or changed:

- There is a new `innodb_autoinc_lock_mode` system variable to configure the locking behavior that InnoDB uses for generating auto-increment values. The default behavior now is slightly different from before, which involves a minor incompatibility for multiple-row inserts that specify an explicit value for the auto-increment column in some but not all rows. See [Section 13.5.6.3, “How AUTO_INCREMENT Handling Works in InnoDB”](#).

Bugs fixed:

- **NDB Cluster**: Backups of `TIMESTAMP` columns made with `ndb_restore` on a MySQL Cluster using data nodes hosts of one endian could not be used to restore the cluster's data to data node hosts of the other endian. (Bug#30134)
- **NDB Cluster** (Replication): Multi-master replication setups did not handle `--log-slave-updates` correctly. (Bug#30017)
- `mysql_install_db` could fail to find its message file. (Bug#30678)
- Non-range queries of the form `SELECT ... FROM ... WHERE keypart_1=const, ..., keypart_n=const ORDER BY ... FOR UPDATE` sometimes were unnecessarily blocked waiting for a lock if another transaction was using `SELECT ... FOR UPDATE` on the same table. (Bug#29804)
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
- `CONNECTION_ID()` always returned 0 for the embedded server (`libmysqld`). (Bug#30389)
- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug#29306)
- Read lock requests that were blocked by a pending write lock request were not allowed to proceed if the statement requesting the write lock was killed. (Bug#21281)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality pre-

dicates and other sargable predicates in disjunctive parts of the condition. ([Bug#30396](#))

- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmpdir` system variable. ([Bug#30287](#))
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. ([Bug#30201](#))
- Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. ([Bug#29536](#))
- `mysqldump` from the MySQL 5.1.21 distribution could not be used to create a dump from a MySQL 5.1.20 or older server. ([Bug#30123](#))
- When using a combination of `HANDLER . . . READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. This was caused in MySQL 5.1.15 by a fix for [Bug#21587](#); the current fix consists of reverting the earlier fix. ([Bug#29474](#))
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. ([Bug#28781](#))

C.1.3. Changes in MySQL 5.1.20 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.22.

C.1.3.1. Changes in release MySQL 5.1.22-ndb-6.3.2-beta (Not yet released)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.19-ndb-6.3.0 and MySQL 5.1.19-ndb-6.3.1, as well as all bugfixes and feature changes which were added in the mainline 5.1.21 and 5.1.22 releases; information about these can be found in [Section C.1.4, “Changes in release 5.1.21 \(16 August 2007\)”](#) and [Section C.1.2, “Changes in release 5.1.22 \(Not yet released\)”](#).

Functionality added or changed:

- It is now possible to control whether fixed-width or variable-width storage is used for a given column of an `NDB` table by means of the `COLUMN_FORMAT` specifier as part of the column's definition in a `CREATE TABLE` or `ALTER TABLE` statement.

It is also possible to control whether a given column of an `NDB` table is stored in memory or on disk, using the `STORAGE` specifier as part of the column's definition in a `CREATE TABLE` or `ALTER TABLE` statement.

For permitted values and other information about `COLUMN_FORMAT` and `STORAGE`, see [Section 12.1.10, “CREATE TABLE Syntax”](#).
- A new cluster management server startup option `--bind-address` makes it possible to restrict management client connections to `ndb_mgmd` to a single host and port. For more information, see [Section 16.6.5.3, “Command Options for ndb_mgmd”](#).
- The protocol for handling global checkpoints has been changed. It is now possible to control how often the GCI number is updated, and how often global checkpoints are written to disk, using the `TimeBetweenEpochs` configuration parameter. This improves the reliability and performance of MySQL Cluster Replication.

GCPs handled using the new protocol are sometimes referred to as “micro-GCPs”.

For more information, see [TimeBetweenEpochs](#).

This release fixes the following bugs:

- For micro-GCPs, fixed the assignment of “fake” CGI events so that they do not cause buckets to be sent out of order. Now, when assigning a GCI to a non-GCI event (that is, creating a pseudo-GCI or “fake” CGI), the GCI that is to arrive is always initiated, even if no known GCI exists, which could occur in the event of a node failure. (Bug#30884)

C.1.3.2. Changes in release MySQL 5.1.22-ndb-6.2.6-beta (Not yet released)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.1, MySQL 5.1.18-ndb-6.2.2 (see [Section C.1.9, “Changes in MySQL 5.1.18 Carrier Grade Edition”](#)), MySQL 5.1.19-ndb-6.2.3, MySQL 5.1.19-ndb-6.2.4, and MySQL 5.1.22-ndb-6.2.5, as well as all bugfixes and feature changes which were added in the mainline 5.1.20, 5.1.21 and 5.1.22 releases; information about these can be found in [Section C.1.5, “Changes in release 5.1.20 \(25 June 2007\)”](#), [Section C.1.4, “Changes in release 5.1.21 \(16 August 2007\)”](#), and [Section C.1.2, “Changes in release 5.1.22 \(Not yet released\)”](#). Also included are most (but not all) bugfixes made in the MCCGE 6.1.x series through MySQL 5.1.15-ndb-6.1.16.

This release fixes the following bugs:

- For micro-GCPs, fixed the assignment of “fake” CGI events so that they do not cause buckets to be sent out of order. Now, when assigning a GCI to a non-GCI event (that is, creating a pseudo-GCI or “fake” CGI), the GCI that is to arrive is always initiated, even if no known GCI exists, which could occur in the event of a node failure. (Bug#30884)
- [EXPLAIN PARTITIONS](#) reported partition usage by queries on [NDB](#) tables according to the standard MySQL hash function than the hash function used in the [NDB](#) storage engine. (Bug#29550)

C.1.3.3. Changes in release MySQL 5.1.22-ndb-6.2.5-beta (06 September 2007)

This is a new Beta development release, fixing recently discovered bugs.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.22-ndb-6.2.5. The file `mysqlcom-5.1.22-ndb-6.2.5-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.1, MySQL 5.1.18-ndb-6.2.2 (see [Section C.1.9, “Changes in MySQL 5.1.18 Carrier Grade Edition”](#)), MySQL 5.1.19-ndb-6.2.3, and MySQL 5.1.19-ndb-6.2.4, as well as all bugfixes and feature changes which were added in the mainline 5.1.20, 5.1.21 and 5.1.22 releases; information about these can be found in [Section C.1.5, “Changes in release 5.1.20 \(25 June 2007\)”](#), [Section C.1.4, “Changes in release 5.1.21 \(16 August 2007\)”](#), and [Section C.1.2, “Changes in release 5.1.22 \(Not yet released\)”](#). Also included are most (but not all) bugfixes made in the MCCGE 6.1.x series through MySQL 5.1.15-ndb-6.1.16.

Functionality added or changed:

- It is now possible to control whether fixed-width or variable-width storage is used for a given column of an [NDB](#) table by means of the [COLUMN_FORMAT](#) specifier as part of the column's definition in a [CREATE TABLE](#) or [ALTER TABLE](#) statement.

It is also possible to control whether a given column of an [NDB](#) table is stored in memory or on disk, using the [STORAGE](#) specifier as part of the column's definition in a [CREATE TABLE](#) or [ALTER TABLE](#) statement.

For permitted values and other information about [COLUMN_FORMAT](#) and [STORAGE](#), see [Section 12.1.10, “CREATE TABLE Syntax”](#).

- A new cluster management server startup option `--bind-address` makes it possible to restrict management client connections to

`ndb_mgmd` to a single host and port. For more information, see [Section 16.6.5.3, “Command Options for ndb_mgmd”](#).

- The following improvements have been made in the `ndb_size.pl` utility:
 - The script is now able to be used with multiple databases; lists of databases and tables can be excluded from analysis.
 - Schema name information has been added to index table calculations.
 - The database name is now an optional parameter, the exclusion of which causes all databases to be examined.
 - If selecting from `INFORMATION_SCHEMA` fails, the script now attempts to fall back to `SHOW TABLES`.
 - A `--real_table_name` option has been added; this designates a table to handle unique index size calculations.
 - The report title has been amended to cover cases where more than one database is being analyzed. ([Bug#28683](#))

Support for a `--socket` option was also added. ([Bug#28253](#))

For more information, see [Section 16.9.15, “ndb_size.pl — NDBCluster Size Requirement Estimator”](#).

- The protocol for handling global checkpoints has been changed. It is now possible to control how often the GCI number is updated, and how often global checkpoints are written to disk, using the `TimeBetweenEpochs` configuration parameter. This improves the reliability and performance of MySQL Cluster Replication.

GCPs handled using the new protocol are sometimes referred to as “micro-GCPs”.

For more information, see [TimeBetweenEpochs](#).

This release fixes the following bugs:

- An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about NDB tables for which the user had no privileges could crash the MySQL Server on which the query was performed. ([Bug#26793](#))
- `ndb_size.pl` failed on tables with `FLOAT` columns whose definitions included commas (for example, `FLOAT(6,2)`). ([Bug#29228](#))
- `DELETE FROM table WHERE primary_key IN (value_list)`, where the `value_list` contained more than one value, called from an `AFTER DELETE` trigger on an NDB table, caused `mysqld` to crash. ([Bug#30337](#))
- A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned NDB error code 4012 (`REQUEST NDBD TIME-OUT`). ([Bug#28804](#))
- **Cluster Replication:** Cluster replication did not handle large `VARCHAR` columns correctly. ([Bug#29904](#))
- When handling `BLOB` columns, the addition of read locks to the lock queue was not handled correctly. ([Bug#30764](#))
- **Disk Data:** `DROP TABLESPACE` failed when a table that had been using the tablespace contained a `BLOB` column. ([Bug#29102](#))
- **APIs:** A call to `CHECK_TIMEDOUT_RET()` in `mgmapi.cpp` should have a call to `DEBUG_CHECK_TIMEDOUT_RET()`. ([Bug#30681](#))
- Discovery of NDB tables did not work correctly with `INFORMATION_SCHEMA`. ([Bug#30667](#))
- A filesystem close could fail during a node or system restart. ([Bug#30646](#))
- Using the `--ndb-cluster-connection-pool` option could cause DDL statements to be executed twice. ([Bug#30598](#))

C.1.4. Changes in release 5.1.21 (16 August 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Note

Subsequent to release, it was discovered that on some platforms, `mysql_install_db` could fail to find its message file, resulting in error messages of the following form:

```
shell> mysql_install_db
Installing MySQL system tables...
070830  9:33:24 [ERROR] Can't find messagefile 'path/share/english/errmsg.sys'
070830  9:33:24 [ERROR] Aborting
```

To deal with this problem, specify a `--language` option to specify the proper pathname to the language file directory. For example:

```
shell> mysql_install_db --language=/path/to/share/english/
```

This problem is corrected in MySQL 5.1.22.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to this release, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to this release and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior. (Bug#29993)
- The `--syslog` option that was introduced in 5.1.20 for `mysqld_safe` (to send error output to `syslog`) did not work correctly: Error output was buffered and not logged immediately. This has been corrected. In addition, some feature changes were made:

Important

The default `mysqld_safe` logging behavior now is `--skip-syslog` rather than `--syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

- A new option, `--syslog-tag=tag`, modifies the default tags written by `mysqld_safe` and `mysqld` to `syslog` to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`. (Bug#29992)
- Several programs now accept `--debug-check` and `--debug-info` options: `mysql`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, `mysqlslap`, `mysqldtest`, `mysql_upgrade`. (Note: `mysql` and `mysqldtest` already accepted `--debug-info`.) `--debug-check` prints debugging information at program exit. `--debug-info` is similar but also prints memory and CPU usage statistics. This patch also corrects a problem for `mysql` that `--debug-info` did not display statistics at exit time. (Bug#30127)
- Transaction support in the `FEDERATED` storage engine has been disabled due to issues with multiple active transactions and sessions on the same `FEDERATED` table. (Bug#29875)
- Previously, prepared statements processed using `PREPARE` and `EXECUTE` were not subject to caching in the query cache if they contained any `?` parameter markers. This limitation has been lifted. (Bug#29318)
- Replication between master and slaves now supports different column numbers within a table on both master and slave. The rules for replication where the table definitions are different has also changed. This supercedes the functionality for replication from the master table to a slave table with more columns that was added in MySQL 5.1.12. For more information, see [Section 15.3.1.20](#),

“Replication with Fewer Columns on the Slave”.

- The SQL thread on a slave now is always allowed to enter [InnoDB](#) even if this would exceed the limit imposed by the [innodb_thread_concurrency](#) system variable. In cases of high load on the slave server (when [innodb_thread_concurrency](#) is reached), this change helps the slave stay more up to date with the master; in the previous behavior, the SQL thread was competing for resources with all client threads active on the slave server. ([Bug#25078](#))

Bugs fixed:

- **Incompatible change:** Several issues were identified for stored programs (stored functions and procedures, triggers, and events) and views containing non-ASCII symbols. These issues involved conversion errors due to incomplete character set information when translating these objects to and from stored format, such as:
 - Parsing the original object definition so that it can be stored.
 - Compiling the stored definition into executable form when the object is invoked.
 - Retrieval of object definitions from [INFORMATION_SCHEMA](#) tables.
 - Displaying the object definition in [SHOW](#) statements. This issue also affected [mysqldump](#), which uses [SHOW](#).

The fix for the problems is to store character set information from the object creation context so that this information is available when the object needs to be used later. The context includes the client character set, the connection character set and collation, and the collation of the database with which the object is associated.

As a result of the patch, several tables have new columns:

- In the [mysql](#) database, the [proc](#) and [event](#) tables now have these columns: [character_set_client](#), [collation_connection](#), [db_collation](#), [body_utf8](#).
- In [INFORMATION_SCHEMA](#), the [VIEWS](#) table now has these columns: [CHARACTER_SET_CLIENT](#), [COLLATION_CONNECTION](#). The [ROUTINES](#), [TRIGGERS](#), and [EVENT](#) tables now have these columns: [CHARACTER_SET_CLIENT](#), [COLLATION_CONNECTION](#), [DATABASE_COLLATION](#).

These columns store the session values of the [character_set_client](#) and [collation_connection](#) system variables, and the collation of the database with which the object is associated. The values are those in effect at object creation time. (The saved database collation is not the value of the [collation_database](#) system variable, which applies to the default database; the database that contains the object is not necessarily the default database.)

Several [SHOW](#) statements now display additional columns corresponding to the new table columns. These statements are: [SHOW CREATE EVENT](#), [SHOW CREATE FUNCTION](#), [SHOW CREATE PROCEDURE](#), [SHOW CREATE VIEW](#), [SHOW EVENTS](#), [SHOW FUNCTION STATUS](#), [SHOW PROCEDURE STATUS](#), [SHOW TRIGGERS](#).

A new statement, [SHOW CREATE TRIGGER](#) is introduced and is used by [mysqldump](#) for producing [CREATE TRIGGER](#) statements.

([Bug#11986](#), [Bug#16291](#), [Bug#19443](#), [Bug#21249](#), [Bug#25212](#), [Bug#25221](#), [Bug#30027](#))

Subsequent to the patch just described, it was discovered that the patch broke [mysql_upgrade](#); this has been corrected. ([Bug#30029](#))

Important

To avoid warnings from the server about the use of old definitions from any release prior to 5.1.21, you should dump stored programs and views with [mysqldump](#) after upgrading to 5.1.21, and then reload them to recreate them with new definitions. Invoke [mysqldump](#) with a [--default-character-set](#) option that names the non-ASCII character set that was used for the definitions when the objects were originally defined.

- Storage engine error conditions in row-based replication were not correctly reported to the user. ([Bug#29570](#))
- **NDB Cluster:** A problem with the fix for [Bug#29354](#) caused an assertion when two local checkpoints were run during node recovery.
- **NDB Cluster:** The server would not compile with **NDB** support on AIX 5.2. ([Bug#10776](#))

- **NDB Cluster** (Replication): Inconsistencies could occur between the master and the slave when replicating Disk Data tables. (Bug#19259)
- **NDB Cluster** (Replication): `mysqld` would segfault on startup when the **NDB** storage engine was enabled and the default character set was a strictly multi-byte character set such as UCS2. (Bug#27404)

This issue does *not* apply to character sets that can contain single-byte characters in addition to multi-byte characters such as UTF-8.

Additional issues remain with regard to the use of multi-byte character sets in MySQL Cluster Replication; see [Section 16.10.3, “Known Issues in MySQL Cluster Replication”](#), for more information.
- **NDB Cluster**: Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug#25941)
- **NDB Cluster** (Disk Data): Performing Disk Data schema operations during a node restart could cause forced shutdowns of other data nodes. (Bug#29501)
- **NDB Cluster** (Disk Data): Disk data meta-information that existed in `ndb` might not be visible to `mysqld`. (Bug#28720)
- **NDB Cluster** (Disk Data): The number of free extents was incorrectly reported for some tablespaces. (Bug#28642)
- **NDB Cluster** (Cluster Replication): When executing a statement where `binlog_format=statement`, the result of the statement was logged both as a statement and as rows. (Bug#29222)
- **NDB Cluster**: Replica redo logs were inconsistently handled during a system restart. (Bug#29354)
- **NDB Cluster**: When restarting a data node, queries could hang during that node's start phase 5, and only continue once the node entered phase 6. (Bug#29364)
- **NDB Cluster**: When a node failed to respond to a `COPY_GCI` signal as part of a global checkpoint, the master node was killed instead instead of the node that actually failed. (Bug#29331)
- **NDB Cluster**: An invalid comparison made during `REDO` validation that could lead to an `ERROR WHILE READING REDO LOG` condition. (Bug#29118)
- **NDB Cluster**: The wrong data pages were sometimes invalidated following a global checkpoint. (Bug#29067)
- **NDB Cluster**: If at least 2 files were involved in `REDO` invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. (Bug#29057)
- The server acquired a global mutex for temporary tables, although such tables are thread-specific. This affected performance by blocking other threads. (Bug#27062)
- `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)
- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug#29838)
- On Windows, client libraries lacked symbols required for linking. (Bug#30118)
- On Windows, the CMake build process did not produce the embedded server library or related binaries. (Bug#29903)
- `SESSION_USER()` returned garbage data (rather than the correct value of the empty string) when executed by a slave SQL thread. (Bug#29878)
- For the `SHOW TABLE TYPES` statement, the server sent incorrect output to clients, possibly causing them to crash. (Bug#30036)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see [Section 9.6, “String Repertoire”](#)). (Bug#28875)
- `REPAIR TABLE ... USE_FRM` could corrupt tables. (Bug#29980)
- `FEDERATED` tables had an artificially low maximum of key length. (Bug#26909)

- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. (Bug#29717)
- In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level. (Bug#24989)
- `--myisam-recover=""` (empty option value) did not disable `MyISAM` recovery. (Bug#29856)
- Very long prepared statements in stored procedures could cause a server crash. (Bug#29856)
- Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. (Bug#28125)
- `mysql_setpermission` tried to grant global-only privileges at the database level. (Bug#14618)
- An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. (Bug#27417)
- An assertion failure occurred within `yaSSL` for very long keys. (Bug#29784)
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. (Bug#29834)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#30020)
- A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. (Bug#29571)
- `InnoDB` could crash if the server was shut down while `innodb_table_monitor` was running. (Bug#28254)
- If `MySQL/InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Fix: If the redo log scan at `InnoDB` startup goes past the last checkpoint, force crash recovery. (Bug#23710)
- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. (Bug#29097)
- `InnoDB` refused to start on some versions of FreeBSD with `LinuxThreads`. This is fixed by enabling file locking on FreeBSD. (Bug#29155)
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. (Bug#29582)
- `SHOW` statements were being written to the slow query log that should not have been. (Bug#30000)
- Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug#30120)
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug#29928)
- Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. (Bug#30200)
- `mysql_install_db` could fail to find script files that it needs. (Bug#28585)
- On Windows, executables did not include Vista manifests. (Bug#24732)
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. (Bug#20815)
- Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. (Bug#24918)
- Log table locking was redesigned, eliminating several lock-related problems:
 - Truncating `mysql.slow_log` in a stored procedure after use of a cursor caused the thread to lock. (Bug#17876)

- Flushing a log table resulted in warnings. ([Bug#23044](#))
- The server would hang when performing concurrent `ALTER TABLE` or `TRUNCATE TABLE` statements against the log tables. ([Bug#25422](#))
- Changing the value of the `general_log` system variable while a global read lock was in place resulted in deadlock. ([Bug#29129](#))

The changes provide more well-defined interface characteristics. See [Section 5.11.1, “Selecting General Query and Slow Query Log Output Destinations”](#).

- LOCK TABLES did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'xx' WAS NOT LOCKED WITH LOCK TABLES` could result. ([Bug#29929](#))
- Creating an event to be executed at a time close to the end of the allowed range (2038-01-19 03:14:07 UTC) would cause the server to crash. ([Bug#28641](#))
- On Windows, Instance Manager would crash if an instance object failed to initialize during startup. This could happen if an incorrect `mysqld` path was supplied in the configuration file. ([Bug#28012](#))
- Instance Manager had a race condition when it received a shutdown request while a guarded `mysqld` instance was starting such that it could fail to stop the `mysqld` instance. ([Bug#28030](#))
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. ([Bug#28838](#))
- After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. ([Bug#26325](#))
- The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. ([Bug#25679](#))
- On Mac OS X, shared-library installation pathnames were incorrect. ([Bug#28544](#))
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. ([Bug#29957](#))
- When determining which transaction to kill after deadlock has been detected, `InnoDB` now adds the number of locks to a transaction's weight, and avoids killing transactions that have modified non-transactional tables. This should reduce the likelihood of killing long-running transactions containing `SELECT ... FOR UPDATE` or `INSERT/REPLACE INTO ... SELECT` statements, and of causing partial updates if the target is a `MyISAM` table. ([Bug#21293](#))
- When using a `FEDERATED` table, the value of `last_insert_id()` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol and/or C API. ([Bug#25714](#))
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. ([Bug#29338](#))
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. ([Bug#15130](#))
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. ([Bug#28591](#))
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. ([Bug#29661](#))
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. ([Bug#29644](#))
- A field packet with `NULL` fields caused a `libmysqlclient` crash. ([Bug#29494](#))
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. ([Bug#29070](#))
- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `SQL_MODE` variable after dumping triggers. ([Bug#29788](#))

- Adding `DISTINCT` could cause incorrect rows to appear in a query result. ([Bug#29911](#))
- Killing an `INSERT DELAYED` thread caused a server crash. ([Bug#29431](#))
- For updates to `InnoDB` tables, a `TIMESTAMP` column with the `ON UPDATE CURRENT_TIMESTAMP` attribute could be updated even when no values actually changed. ([Bug#29310](#))
- The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. ([Bug#29360](#))
- Conversion of ASCII DEL (`0x7F`) to Unicode incorrectly resulted in QUESTION MARK (`0x3F`) rather than DEL. ([Bug#29499](#))
- A left join between two views could produce incorrect results. ([Bug#29604](#))
- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. ([Bug#29740](#))
- If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. ([Bug#29850](#))
- Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. ([Bug#24192](#))
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. ([Bug#29739](#))
- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. ([Bug#29555](#))
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. ([Bug#18828](#))
- On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. ([Bug#29469](#))
- For the general query log, logging of prepared statements executed via the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. ([Bug#13326](#))
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). ([Bug#21074](#))
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. ([Bug#26141](#))
- On 64-bit platforms, the filesort code (for queries with `GROUP BY` or `ORDER BY`) could crash due to an incorrect pointer size. ([Bug#29610](#))
- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. ([Bug#29898](#))
- Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. ([Bug#28524](#))
- A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. ([Bug#28249](#))
- The full-text parser could enter an infinite loop if it encountered an illegal multi-byte sequence or a sequence that has no mapping to Unicode. ([Bug#29464](#))
- Failure to consider collation when comparing space characters could lead to incorrect index entry order, making it impossible to find some index values. ([Bug#29461](#))
- Several `InnoDB` assertion failures were corrected. ([Bug#25645](#))
- `InnoDB` displayed an incorrect error message when a `CREATE TABLE` statement exceeded the `InnoDB` maximum allowable row size. ([Bug#21101](#))

- InnoDB produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared.` (Bug#20090)
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. InnoDB now retries forever until the condition goes away. (Bug#9709)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug#28839)
- MyISAM corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug#29333)
- Searching a `FULLTEXT` index for a word with the boolean mode truncation operator could cause an infinite loop. (Bug#29445)
- `CHECK TABLE` could erroneously report table corruption for a `CSV` table if multiple threads were modifying the table at the same time. (Bug#29253)
- Clients using SSL could hang the server. (Bug#29579)
- Single-row inserts could report a row count greater than one. (Bug#29692)
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. (Bug#29729)
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. (Bug#28551)
- Indexing column prefixes in InnoDB tables could cause table corruption. (Bug#28138)
- `SHOW INNODB STATUS` caused an assertion failure under high load. (Bug#22819)
- If a slave timed out while registering with the master to which it was connecting, auto-reconnect failed thereafter. (Bug#19328)
- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. (Bug#29687)
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. (Bug#21023, Bug#25486)
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug#29294)
- A duplicate-key error message could display an incorrect key value when not all columns of the key were used to select rows for update. (Bug#28158)
- For some event-creation problems, the server displayed messages that implied the problems were errors when they were only warnings. (Bug#27406)
- Error returns from the `time()` system call were ignored. (Bug#27198)
- `ALTER DATABASE` did not require at least one option. (Bug#25859)
- Creation of a legal stored procedure could fail if no default database had been selected. (Bug#29050)
- `mysqld_safe` produced error messages and did not create the error log file under some circumstances. (Bug#29634)
- The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug#29734)
- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. (Bug#25511)
- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the

statement completely. This occurred because the rows were treated as individual inserts.

Now **FEDERATED** performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
- Bulk-insert handling does not occur for **INSERT ... ON DUPLICATE KEY UPDATE**.

([Bug#25513](#))

- **ALTER VIEW** is not supported as a prepared statement but was not being rejected. **ALTER VIEW** is now prohibited as a prepared statement or when called within stored routines. ([Bug#28846](#))
- Calling **mysql_options()** after **mysql_real_connect()** could cause clients to crash. ([Bug#29247](#))
- If an **ENUM** column contained '' as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as ''), using **ALTER TABLE** to modify the column definition caused the 0 values to be given the numeric value of the non-zero '' member. ([Bug#29251](#))
- Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. ([Bug#27333](#))
- Use of **SHOW BINLOG EVENTS** for a non-existent log file followed by **PURGE MASTER LOGS** caused a server crash. ([Bug#29420](#))
- A number of unsupported constructs — including prohibited constructs, the **UCASE()** function, and nested function calls — were permitted in partitioning expressions. ([Bug#18198](#), [Bug#26082](#), [Bug#29308](#))
- **SHOW BINLOG EVENTS** displayed incorrect values of **End_log_pos** for events associated with transactional storage engines. ([Bug#22540](#))
- **mysqldump** created a stray file when a given a too-long filename argument. ([Bug#29361](#))
- The semantics of **BIGINT** depended on platform-specific characteristics. ([Bug#29079](#))
- **mysqld** failed to exit during shutdown. ([Bug#29133](#))
- Inserting a negative number into a **CSV** table could corrupt it. ([Bug#29353](#))
- Deleting from a **CSV** table could corrupt it. ([Bug#29411](#))
- For a statement of the form **CREATE t1 SELECT integer_constant**, the server created the column using the **DECIMAL** data type for large negative values that are within the range of **BIGINT**. ([Bug#28625](#))
- Runtime changes to the **log_queries_not_using_indexes** system variable were ignored. ([Bug#28808](#))
- Under ActiveState Perl, **mysql-test-run.pl** would not run. ([Bug#18415](#))
- Under ActiveState Perl, **mysql-test-run.pl** could kill itself when attempting to kill other processes. ([Bug#25657](#))
- Assertion failure could occur for grouping queries that employed **DECIMAL** user variables with assignments to them. ([Bug#29417](#))
- For **CAST(expr AS DECIMAL(M,D))**, the limits of 65 and 30 on the precision (*M*) and scale (*D*) were not enforced. ([Bug#29415](#))
- Corrupt data resulted from use of **SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'**, where *c* is a digit or minus sign, followed by **LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'**. ([Bug#29442](#))
- **AsText()** could fail with a buffer overrun. ([Bug#29166](#))
- Inserting into **InnoDB** tables and executing **RESET MASTER** in multiple threads cause assertion failure in debug server binaries. ([Bug#28983](#))

- The index merge union access algorithm could produce incorrect results with **InnoDB** tables. The problem could also occur for queries that used **DISTINCT**. (Bug#25798)
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an **ORDER BY** clause in its definition. (Bug#29392)
- **gcov** coverage-testing information was not written if the server crashed. (Bug#29543)
- **FULLTEXT** indexes could be corrupted by certain **gbk** characters. (Bug#29299)
- **REPLACE**, **INSERT IGNORE**, and **UPDATE IGNORE** did not work for **FEDERATED** tables. (Bug#29019)
- **CHECK TABLE** for **ARCHIVE** tables could falsely report table corruption or cause a server crash. (Bug#29207)
- **SELECT ... FOR UPDATE** with partitioned tables could cause a server crash. (Bug#28026)
- Updates to rows in a partitioned table could update the wrong column. (Bug#26827)
- Updates to a **CSV** table could cause a server crash or update the table with incorrect values. (Bug#28971)
- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. (Bug#27564)
- The server crashed when the size of an **ARCHIVE** table grew larger than 2GB. (Bug#15787)
- An assertion failure occurred if a query contained a conjunctive predicate of the form **view_column = constant** in the **WHERE** clause and the **GROUP BY** clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form **view_column = constant** in the **WHERE** clause and the **GROUP BY** clause contained a reference to the same view column. (Bug#29104)
- Replication of partitioned tables using the **InnoDB** storage engine failed with **binlog-format=ROW** or **binlog-format=MIXED**. (Bug#28430)
- If a storage engine has its own logging capability, then any statement using both this engine and some other engine not having its own logging could not be correctly logged, due to the fact that entries from one engine could be logged before entries from the other engine were. This did not generate any error messages when it occurred.

Now, if multiple storage engines are used in a statement and at least one of them has its own logging capability, then an error message is generated and the statement is not executed. (Bug#28722)

Note

Currently, the only storage engine to have its own logging capability is **NDBCLUSTER**.

- Using the **READ COMMITTED** transaction isolation level caused mixed and statement-based replication to fail. (Bug#23051)
- The server returned data from **SHOW CREATE TABLE** statement or a **SELECT** statement on an **INFORMATION_SCHEMA** table using the **binary** character set. (Bug#10491)
- Mixing binary and **utf8** columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. (Bug#29205)
- **LOCK TABLES** was not atomic when more than one **InnoDB** tables were locked. (Bug#29154)
- Queries that performed a lookup into a **BINARY** index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for non-debug builds. (Bug#29087)
- Selecting a column not present in the selected-from table caused an extra error to be produced by **SHOW ERRORS**. (Bug#28677)
- If an **INSERT INTO ... SELECT** statement inserted into the same table that the **SELECT** retrieved from, and the **SELECT** included **ORDER BY** and **LIMIT** clauses, different data was inserted than the data produced by the **SELECT** executed by itself. (Bug#29095)
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit **libmysql.dll** to a 32-bit application like the Config Wizard. (Bug#14649)
- For a join with **GROUP BY** and/or **ORDER BY** and a view reference in the **FROM** list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug#28898)

- For a `ucs2` column, `GROUP_CONCAT()` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug#28925)
- Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). (Bug#27345)
- The Windows implementation of `pthread_join()` was incorrect and could cause crashes. (Bug#26564)
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. (Bug#29261)
- Many threads accessing a `CSV` table simultaneously could cause an assertion failure. (Bug#29252)
- `mysqlbinlog --hexdump` generated incorrect output due to omission of the '#' comment character for some comment lines. (Bug#28293)
- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would allow one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. (Bug#26642)
- Dropping the definer of an active event caused the server to crash. (Bug#28924)
- Executing `ALTER EVENT` on an event whose definer's event creation privileges had been revoked cause the server to crash. (Bug#28873)
- Creating an event using `ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL ...` could in some cases cause `mysqld` to crash. (Bug#28881)
- Under some circumstances, a `SELECT ... FROM mysql.event` could cause the server to crash. (Bug#29156)
- Some functions when used in partitioning expressions could cause `mysqld` to crash. (Bug#27084)
- The `SUBSTRING()` function returned the the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value '0'. (Bug#27130)
- The `LOCATE()` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str, NULL) IS NULL`, erroneously evaluated to `FALSE`. (Bug#27932)
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug#25602)
- A network structure was initialized incorrectly, leading to embedded server crashes. (Bug#29117)
- Fixed a case of unsafe aliasing in the source that caused a client library crash when compiled with `gcc 4` at high optimization levels. (Bug#27383)

C.1.5. Changes in release 5.1.20 (25 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** `mysqld_safe` now supports error logging to `syslog` on systems that support the `logger` command.

The new `--syslog` and `--skip-syslog` options can be used instead of the `--log-error` option to control logging behavior, as described in [Section 5.3.1, “mysqld_safe — MySQL Server Startup Script”](#). The default is to use `syslog`, which differs from the previous default behavior of writing an error log file. ([Bug#4858](#))

Currently, logging to `syslog` may fail to operate correctly in some cases, so we recommend that you use `--skip-syslog` or `--log-error`. To maintain the older behavior if you were using no error-logging option, use `--skip-syslog`. If you were using `--log-error`, continue to use it.

Note: In 5.1.21, the default is changed to `--skip-syslog`, which is compatible with releases prior to 5.1.20.

- **Incompatible change:** It is no longer possible to partition the log tables. ([Bug#27816](#))
- User variables and stored procedure variables are now supported for use in XPath expressions employed as arguments to the `ExtractValue()` and `UpdateXML()` functions. ([Bug#26518](#))

This means that:

- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()`, or remove some parts of the data using `REPLACE()`.

See [Section 11.10, “XML Functions”](#), for more information.

- **NDB Cluster:** A new configuration parameter `ODirect` causes **NDB** to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.
- **NDB Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 16.12.1, “Configuring MySQL Cluster to use SCI Sockets”](#). ([Bug#25470](#))
- **NDB Cluster:** `auto_increment_increment` and `auto_increment_offset` are now supported for **NDB** tables. ([Bug#26342](#))
- **NDB Cluster:** The cluster management client now stores command history between sessions. ([Bug#29073](#))
- **NDB Cluster:** `ndb_error_reporter` now preserves timestamps on files. ([Bug#29074](#))
- **NDB Cluster:** The `TimeBetweenWatchdogCheckInitial` configuration parameter was added to allow setting of a separate watchdog timeout for memory allocation during startup of the data nodes. See [Section 16.4.4.5, “Defining Data Nodes”](#), for more information. ([Bug#28899](#))
- **NDB Cluster:** It is now possible to set the maximum size of the allocation unit for table memory using the `MaxAllocate` configuration parameter. ([Bug#29044](#))
- If a **MERGE** table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. ([Bug#26976](#))
- The `SQL_MODE`, `FOREIGN_KEY_CHECKS`, `UNIQUE_CHECKS`, character set/collations, and `SQL_AUTO_IS_NULL` session variables are written to the binary log and honoured during replication. See [Section 5.11.4, “The Binary Log”](#).
- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. Exception: The library for the `libmysqld` embedded server is not shared except on Windows. ([Bug#13450](#), [Bug#16520](#), [Bug#26767](#))

Bugs fixed:

- **Security fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug and providing details and a proof of concept. ([CVE-2007-3780](#), [Bug#28984](#))

- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege. (CVE-2007-3781, Bug#25578)

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. (Bug#23667)

- **Incompatible change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug#24733)
- **Incompatible change:** Some error codes had error numbers in MySQL 5.1 different from the numbers in MySQL 5.0. In MySQL 5.1, error numbers have been changed to match the MySQL 5.0 values: Error codes with value of 1458 or higher have changed in MySQL 5.1 now. Client applications designed to work with MySQL 5.1 with hard-coded error code values (for example, in statements such as `if (mysql_errno(mysql) == 1463) { ... }`) need to be updated in the source code. All clients designed to work with MySQL 5.1 that test error codes (for example, in statements such as `if (mysql_errno(mysql) == ER_VIEW_RECURSIVE) { ... }`) should be recompiled. Existing 5.0 clients should now work, without changes or recompilation, against servers for MySQL 5.1.20 or higher. (Bug#29245)
- **Incompatible change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
- **NDB Cluster:** A query having a large `IN(...)` or `NOT IN(...)` list in the `WHERE` condition on an `NDB` table could cause `mysqld` to crash. (Bug#29185)
- **NDB Cluster** (Disk Data): When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. (Bug#29176)
- **NDB Cluster:** In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `P0.sysfile` files, `QMGR` could refuse to start, issuing an invalid `INSUFFICIENT NODES FOR RESTART` error instead. (Bug#29167)
- **NDB Cluster:** Memory corruption could occur due to a problem in the `DBTUP` kernel block. (Bug#29229)
- **NDB Cluster** (APIs): An invalid error code could be set on transaction objects by `BLOB` handling code. (Bug#28724)
- **NDB Cluster:** Attempting to restore a `NULL` row to a `VARBINARY` column caused `ndb_restore` to fail. (Bug#29103)
- **NDB Cluster:** `ndb_mgm` could hang when connecting to a nonexistent host. (Bug#28847)
- **NDB Cluster** (APIs): The timeout set using the MGM API `ndb_mgm_set_timeout()` function was incorrectly interpreted as seconds rather than as milliseconds. (Bug#29063)
- **NDB Cluster:** When shutting down `mysqld`, the `NDB` binlog process was not shut down before log cleanup began. (Bug#28949)
- **NDB Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint. Now only the master updates the active status. (Bug#28717)
- **NDB Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. (Bug#27640)
- **NDB Cluster:** A regression in the heartbeat monitoring code could lead to node failure under high load. This issue affected MySQL 5.1.19 only. (Bug#28783)
- **NDB Cluster** (Replication): When replicating `MyISAM` or `InnoDB` tables to a MySQL Cluster, it was not possible to determine exactly what had been applied following a shutdown of the slave cluster or `mysqld` process. (Bug#26783)
- **NDB Cluster:** Having large amounts of memory locked caused swapping to disk. (Bug#28751)
- **NDB Cluster:** The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `con -`

`fig.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. (Bug#28749)

- **NDB Cluster**: LCP files were not removed following an initial system restart. (Bug#28726)
- **NDB Cluster**: A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- **NDB Cluster** (Disk Data): When loading data into a cluster following a version upgrade, the data nodes could forcibly shut down due to page and buffer management failures. (Bug#28525)
- **NDB Cluster**: `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. (Bug#28719)
- **NDB Cluster**: A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
- **NDB Cluster** Disk Data: Repeated `INSERT` and `DELETE` operations on a Disk Data table having one or more large `VARCHAR` columns could cause data nodes to fail. (Bug#20612)
- **NDB Cluster** (Replication): A replicated unique key allowed duplicate key inserts on the slave. (Bug#27044)
- In `SHOW SLAVE STATUS` output, `Last_Errno` and `Last_Error` were not set after `master_retry_count` errors had occurred. To provide additional information, the statement now displays four additional columns:
 - `Last_IO_Errno`: The number of the last error that caused the I/O thread to stop
 - `Last_IO_Error`: A description of the last error that caused the I/O thread to stop
 - `Last_SQL_Errno`: The number of the last error that caused the SQL thread to stop
 - `Last_SQL_Error`: A description of the last error that caused the SQL thread to stop

Also, `Last_Errno` and `Last_Error` now are aliases for `Last_SQL_Errno` and `Last_SQL_Error`. (Bug#24954)

- `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. (Bug#29030)
- It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of an event group. (Bug#28618)
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
- The server made strong assumptions about the structure of the `general_log` and `slow_log` log tables: It supported only the table structure defined in the `mysql` database creation scripts. The server also allowed limited `ALTER TABLE` operations on the log tables, but adding an `AUTO_INCREMENT` column did not properly initialize the column, and subsequent inserts into the table could fail to generate correct sequence numbers. Now an `ALTER TABLE` statement that adds an `AUTO_INCREMENT` column populates the column correctly. In addition, when the server writes a log table row, it will set columns not present in the original table structure to their default values. (Bug#27857)
- The embedded server library displayed error messages at startup if the `mysql.plugin` table was not present. This no longer occurs. (Bug#25800)
- The `-lmtalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- Embedded `/* ... */` comments were handled incorrectly within the definitions of stored programs and views, resulting in malformed definitions. This also affected binary log contents. (Bug#25411, Bug#26302)
- The `binlog_format` system variable value was empty if the server was started with binary logging disabled. Now it is set to `MIXED`. (Bug#28752)
- Conversion of U+00A5 YEN SIGN and U+203E OVERLINE from `ucs2` to `ujis` produced incorrect results. (Bug#28600)
- Some valid identifiers were not parsed correctly. (Bug#28127)
- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. (Bug#28860)

- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. (Bug#24924)
- On Windows, an application that called `mysql_thread_init()` but forgot to call `mysql_thread_end()` would get this error: `Error in my_thread_global_end()` (Bug#25621)
- A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. (Bug#27592)
- `INSERT ... ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug#28904)
- Using events in replication could cause the slave to crash. (Bug#28953)
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug#27029)
- A `FLUSH TABLES WITH READ LOCK` statement followed by a `FLUSH LOGS` statement caused a deadlock if the general log or the slow query log was enabled. (Bug#26380)
- The `TRUNCATE` statement was handled differently by the server when row-based logging was in effect, even though the binlogging format in effect does not effect the fact that `TRUNCATE` is always logged as a statement. (Bug#29130)
- When the query cache was fully used, issuing `RENAME DATABASE` or `RENAME SCHEMA` could cause the server to hang, with 100% CPU usage. (Bug#28211)
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` (“\”) character, used by MySQL as the escape character. (Bug#26711)
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

(Bug#29053)

- Queries using UDFs or stored functions were cached. (Bug#28921)
- The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. (Bug#27716)
- `SHOW ENGINES` and queries on `INFORMATION_SCHEMA.ENGINES` did not use the same values for representing the same storage engine states. (Bug#27684)
- Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug#28690)
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. (Bug#28494)
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug#28716)
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. (Bug#28571)
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. (Bug#28561)
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. (Bug#28505)
- Using `ALTER TABLE` to move columns resulted only in the columns being renamed. The table contents were not changed.

[Bug#28427](#))

- Storing a large number into a [FLOAT](#) or [DOUBLE](#) column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. ([Bug#28121](#))
- [HASH](#) indexes on [VARCHAR](#) columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a [MEMORY](#) table with unique key constraints. A consequence was that internal [MEMORY](#) tables used for [GROUP BY](#) calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to [MyISAM](#), and that error was incorrectly reported as a [table is full](#) error. ([Bug#27643](#))
- The server deducted some bytes from the [key_cache_block_size](#) option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the [key_cache_block_size](#) system variable to a value that is not a power of two resulted in [MyISAM](#) table corruption. ([Bug#23068](#), [Bug#25853](#), [Bug#28478](#))
- [ON](#) conditions from [JOIN](#) expressions were ignored when checking the [CHECK OPTION](#) clause while updating a multiple-table view that included such a clause. ([Bug#27827](#))
- The [IS_UPDATABLE](#) column in the [INFORMATION_SCHEMA.VIEWS](#) table was not always set correctly. ([Bug#28266](#))
- For [CAST\(\)](#) of a [NULL](#) value with type [DECIMAL](#), the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. ([Bug#28250](#))
- [DECIMAL](#) values beginning with nine 9 digits could be incorrectly rounded. ([Bug#27984](#))
- For debug builds, [ALTER TABLE](#) could trigger an assertion failure due to occurrence of a deadlock when committing changes. ([Bug#28652](#))
- Searches on indexed and non-indexed [ENUM](#) columns could return different results for empty strings. ([Bug#28729](#))
- Non-[utf8](#) characters could get mangled when stored in [CSV](#) tables. ([Bug#28862](#))
- If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. ([Bug#27563](#))
- When [ALTER TABLE](#) was used to add a new [DATE](#) column with no explicit default value, ['0000-00-00'](#) was used as the default even if the SQL mode included the [NO_ZERO_DATE](#) mode to prohibit that value. A similar problem occurred for [DATETIME](#) columns. ([Bug#27507](#))
- Statements within triggers ignored the value of the [low_priority_updates](#) system variable. ([Bug#26162](#))
- The server was ignoring the return value of the [parse\(\)](#) function for full-text parser plugins. ([Bug#18839](#))
- Queries that used [UUID\(\)](#) were incorrectly allowed into the query cache. (This should not happen because [UUID\(\)](#) is non-deterministic.) ([Bug#28897](#))
- The [Bytes_received](#) and [Bytes_sent](#) status variables could hold only 32-bit values (not 64-bit values) on some platforms. ([Bug#28149](#))
- [SHOW GLOBAL VARIABLES](#) repeated some variable names. ([Bug#28580](#))
- Passing a [DECIMAL](#) value as a parameter of a statement prepared with [PREPARE](#) resulted in an error. ([Bug#28509](#))
- For attempts to open a non-existent table, the server should report [ER_NO_SUCH_TABLE](#) but sometimes reported [ER_TABLE_NOT_LOCKED](#). ([Bug#27907](#))
- Due to a race condition, executing [FLUSH PRIVILEGES](#) in one thread could cause brief table unavailability in other threads. ([Bug#24988](#))
- Conversion errors could occur when constructing the condition for an [IN](#) predicate. The predicate was treated as if the affected column contains [NULL](#), but if the [IN](#) predicate is inside [NOT](#), incorrect results could be returned. ([Bug#22855](#))
- Linux binaries were unable to dump core after executing a [setuid\(\)](#) call. ([Bug#21723](#))
- Using up-arrow for command-line recall in [mysql](#) could cause a segmentation fault. ([Bug#10218](#))
- Long pathnames for internal temporary tables could cause stack overflows. ([Bug#29015](#))

- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- In MySQL 5.1.15, a new error code `ER_DUP_ENTRY_WITH_KEY_NAME` (1582) was introduced to replace `ER_DUP_ENTRY` (1062) so that the key name could be provided instead of the key number. This was unnecessary, so `ER_DUP_ENTRY` is used again and the key name is printed. The incompatibility introduced in 5.1.15 no longer applies. (Bug#28842)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug#28574)
- The server crashed when attempting to open a table having a `#mysql50#` prefix in the database or table name. The server now will not open such tables. (This prefix is reserved by `mysql_upgrade` for accessing 5.0 tables that have names not yet encoded for 5.1.) (Bug#26402)
- Running `SHOW TABLE STATUS` while performing a high number of inserts on partitioned tables with a great many partitions could cause the server to crash. (Bug#28806)
- An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- The `PARTITION_COMMENT` column of the `INFORMATION_SCHEMA.PARTITIONS` table had the wrong default value. (Bug#28007)
- Performing `ALTER TABLE ... ADD PARTITION` or `ALTER TABLE DROP PARTITION` could result in inconsistent data, or cause the server to crash, if done concurrently with other accesses to the table. (Bug#28477, Bug#28488)
- InnoDB tables using an indexed `CHAR` column with `utf8` as the default character set could fail to return the right rows. (Bug#28878)
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. (Bug#28778)
- When using a `MEMORY` table on Mac OS X, dropping a table and then creating a table with the same name could cause the information of the deleted table to remain accessible, leading to index errors. (Bug#28309)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. (Bug#28811)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug#28763)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- When constructing the path to the original `.frm` file, `ALTER ... RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. (Bug#28754)
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug#28553)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- Stack overflow caused server crashes. (Bug#21476)
- The test case for `ysqldump` failed with `bin-log` disabled. (Bug#28372)

- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- Attempting to create an index on a `BIT` column failed after modifying the column. (Bug#28631)
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. This was a regression introduced by the fix for Bug#23491. (Bug#28605)
- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. (Bug#28598)
- When upgrading from MySQL 5.1.17 to 5.1.18, `mysql_upgrade` and `mysql_fix_privilege_tables` did not upgrade the system tables relating to the Event Scheduler correctly. (Bug#28521)
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. This issue was introduced by the fix for Bug#19714. (Bug#28492)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug#28728)
- Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug#12826, Bug#26842)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. (Bug#28522)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
- For a given user variable `@v`, the statements `SELECT @v` and `CREATE TABLE ... AS SELECT @v` did not return the same data type. (Bug#26277)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- A number of `SHOW` statements caused `mysqld` to crash on recent versions of Solaris. This issue is believed to be present only in MySQL 5.1.12 and later. (Bug#23810)
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug#18950)
- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug#28476)
- When using `mysqlbinlog` with `--read-from-remote-server` to load the data direct from a remote MySQL server would cause a core dump when dumping certain binary log events. (Bug#17654)
- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug#22725)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns. (Bug#4968, Bug#6895, Bug#19182, Bug#19733, Bug#22060, Bug#24879)
- The query `SELECT /*2*/ user, host, db, info FROM INFORMATION_SCHEMA.PROCESSLIST WHERE`

```
(command!='Daemon' || user='event_scheduler') AND (info IS NULL OR info NOT LIKE '%processlist%') ORDER BY INFO
```

yielded inconsistent results. (Bug#26338)

- Sending debugging information from a dump of the Event Scheduler to `COM_DEBUG` could cause the server to crash. (Bug#28075)
- Setting an interval of `EVERY 0 SECOND` for a scheduled event caused the server to crash. (Bug#28666)
- Following an invalid call to `UpdateXML()`, calling the function again (even if valid) crashed the server. (Bug#27898)
- Calling the `UpdateXML()` function using invalid XPath syntax caused memory corruption possibly leading to a crash of the server. (Bug#28558)

C.1.6. Changes in release 5.1.19 (25 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- `INSERT DELAYED` statements for `BLACKHOLE` tables caused a server crash. The `BLACKHOLE` storage engine now supports `INSERT DELAYED`. (Bug#27998)
- The `BLACKHOLE` storage engine now supports `LOCK TABLES` and `UNLOCK TABLES`. (Bug#26241)
- The data type used for the `VARIABLE_VALUE` column of the following `INFORMATION_SCHEMA` tables has been changed to `VARCHAR`:
 - `GLOBAL_STATUS`
 - `SESSION_STATUS`
 - `GLOBAL_VARIABLES`
 - `SESSION_VARIABLES`For more information, see [Section 23.24, “The INFORMATION_SCHEMA GLOBAL_STATUS and SESSION_STATUS Tables”](#), [Section 23.25, “The INFORMATION_SCHEMA GLOBAL_VARIABLES and SESSION_VARIABLES Tables”](#), and [Bug#26994](#)
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. (Bug#27994)

Bugs fixed:

- **Security fix:** Use of a view could allow a user to gain update privileges for tables in other databases. (CVE-2007-3782, Bug#27878)
- **Security fix:** UDFs are supposed to be loadable only from the plugin directory, but this restriction was not being enforced. (Bug#28341)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)

- **NDB Cluster**: When an API node sent more than 1024 signals in a single batch, **NDB** would process only the first 1024 of these, and then hang. ([Bug#28443](#))
- **NDB Cluster** (Disk Data): DDL operations were not supported on a partially started cluster. ([Bug#24631](#))
- **NDB Cluster**: A delay in obtaining **AUTO_INCREMENT** IDs could lead to excess temporary errors. ([Bug#28410](#))
- **NDB Cluster**: Local checkpoint files related to dropped **NDB** tables were not removed. ([Bug#28348](#))
- **NDB Cluster**: A failure to release internal resources following an error could lead to problems with single user mode. ([Bug#25818](#))
- **NDB Cluster**: Multiple operations involving deletes followed by reads were not handled correctly. ([Bug#28276](#))

Note

This issue could also affect MySQL Cluster Replication.

- **NDB Cluster** (Disk Data): Extremely large inserts into Disk Data tables could lead to data node failure in some circumstances. ([Bug#27942](#))
- **NDB Cluster**: Repeated insertion of data generated by **mysqldump** into **NDB** tables could eventually lead to failure of the cluster. ([Bug#27437](#))
- **NDB Cluster**: Restarting a data node caused SQL nodes to log repeatedly and unnecessarily the status of the event buffer. ([Bug#27292](#))

(This issue was known to occur in MySQL 5.1.16 and later only.)
- **NDB Cluster**: **ndb_mgmd** failed silently when the cluster configuration file contained invalid **[TCP]** entries. ([Bug#27207](#))
- **NDB Cluster**: **ndb_connectstring** did not appear in the output of **SHOW VARIABLES**. ([Bug#26675](#))
- **NDB Cluster** (APIs): In a multi-operation transaction, a delete operation followed by the insertion of an implicit **NULL** failed to overwrite an existing value. ([Bug#20535](#))
- Selecting **MIN()** on an indexed column that contained only **NULL** values caused **NULL** to be returned for other result columns. ([Bug#27573](#))
- **mysql_upgrade** failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. ([Bug#28401](#))
- Some test suite files were missing from some MySQL-test packages. ([Bug#26609](#))
- When dumping procedures, **mysqldump --compact** generated output that restored the session variable **SQL_MODE** without first capturing it. When dumping routines, **mysqldump --compact** neither set nor retrieved the value of **SQL_MODE**. ([Bug#28223](#))
- The second execution of a prepared statement from a **UNION** query with **ORDER BY RAND()** caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. ([Bug#27937](#))
- **CURDATE()** is less than **NOW()**, either when comparing **CURDATE()** directly (**CURDATE() < NOW()** is true) or when casting **CURDATE()** to **DATE(CAST(CURDATE() AS DATE) < NOW()** is true). However, storing **CURDATE()** in a **DATE** column and comparing **col_name < NOW()** incorrectly yielded false. This is fixed by comparing a **DATE** column as **DATETIME** for comparisons to a **DATETIME** constant. ([Bug#21103](#))
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with **DATE_ADD()**, **DATE_SUB()**, **+** **INTERVAL**, and **-** **INTERVAL**. (For example, **DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)** became **'2050-01-01 00:00:00'**.) ([Bug#18997](#))
- The result for **CAST()** when casting a value to **UNSIGNED** was limited to the maximum signed **BIGINT** value, not the maximum unsigned value. ([Bug#8663](#))
- Running **CHECK TABLE** concurrently with a **SELECT**, **INSERT** or other statement on Windows could corrupt a MyISAM table. ([Bug#25712](#))
- The error message for error number **137** did not report which database/table combination reported the problem. ([Bug#27173](#))

- Changing the size of a key buffer that is under heavy use could cause a server crash. The fix partially removes the limitation that `LOAD INDEX INTO CACHE` fails unless all indexes in a table have the same block size. Now the statement fails only if `IGNORE LEAVES` is specified. ([Bug#17332](#))
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. ([Bug#28272](#))
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. ([Bug#28337](#))
- `libmysql.dll` could not be dynamically loaded on Windows. ([Bug#28358](#))
- Portability problems caused by use of `isinf()` were corrected. ([Bug#28240](#))
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. ([Bug#27415](#))
- A large filesort could result in a division by zero error and a server crash. ([Bug#27119](#))
- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row). ([Bug#21483](#))
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. ([Bug#28000](#))
- Quoted labels in stored routines were mishandled, rendering the routines unusable. ([Bug#21513](#))
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. ([Bug#27792](#))
- Some `ALTER TABLE` statements that worked in MySQL 5.0 did not work in 5.1. ([Bug#28415](#))
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. ([Bug#26977](#))
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. ([Bug#24508](#))
- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. ([Bug#24738](#))
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. ([Bug#20903](#))
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. ([Bug#22427](#))
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. ([Bug#20662](#))
- It was not possible to use the value `-9223372036854775808` (that is, `-MAXVALUE + 1`) when specifying a `LIST` partition. ([Bug#28005](#))
- Some `InnoDB` variables were missing from the output of `mysqld --verbose --help`. ([Bug#26987](#))
- `CAST()` to `DECIMAL` did not check for overflow. ([Bug#27957](#))
- Views ignored precision for `CAST()` operations. ([Bug#27921](#))
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. ([Bug#28189](#))
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. ([Bug#28375](#))
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. ([Bug#28133](#))
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. ([Bug#27670](#))

C.1.7. Changes in MySQL 5.1.19 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.19.

C.1.7.1. Changes in release MySQL 5.1.19-ndb-6.3.1-beta (04 July 2007)

This is a new Beta development release, fixing a recently discovered bug.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.19-ndb-6.3.1. The file `mysqlcom-5.1.19-ndb-6.3.1-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.19-ndb-6.3.0, as well as all bugfixes and feature changes which were added in the mainline 5.1.19 release; information about these can be found in [Section C.1.6, “Changes in release 5.1.19 \(25 May 2007\)”](#).

This release fixes the following bug:

- Batching of transactions was not handled correctly in some cases. ([Bug#29525](#))

C.1.7.2. Changes in release MySQL 5.1.19-ndb-6.3.0-beta (02 July 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.19-ndb-6.3.0. The file `mysqlcom-5.1.19-ndb-6.3.0-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.1, MySQL 5.1.18-ndb-6.2.2 (see [Section C.1.9, “Changes in MySQL 5.1.18 Carrier Grade Edition”](#)), and MySQL 5.1.19-ndb-6.2.3 (see [Section C.1.7.4, “Changes in release MySQL 5.1.19-ndb-6.2.3-beta \(02 July 2007\)”](#)), as well as all bugfixes and feature changes which were added in the mainline 5.1.19 release; information about these can be found in [Section C.1.6, “Changes in release 5.1.19 \(25 May 2007\)”](#).

Functionality added or changed:

- **MySQL Cluster Replication:** This release implements conflict resolution, which makes it possible to determine on a per-table basis whether or not an update to a given row on the master should be applied on the slave. For more information, see [Section 16.10.10, “MySQL Cluster Replication Conflict Resolution”](#).
- A new configuration parameter `ODirect` causes **NDB** to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.

C.1.7.3. Changes in release MySQL 5.1.19-ndb-6.2.4-beta (04 July 2007)

This is a new Beta development release, fixing recently discovered bugs.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL](#)

[Cluster from Source Code](#)". You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.19-ndb-6.2.4. The file `mysqlcom-5.1.19-ndb-6.2.4-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.1, MySQL 5.1.18-ndb-6.2.3 (see [Section C.1.9, "Changes in MySQL 5.1.18 Carrier Grade Edition"](#)), and MySQL 5.1.19-ndb-6.2.4, as well as all bugfixes and feature changes which were added in the mainline 5.1.19 release; information about these can be found in [Section C.1.6, "Changes in release 5.1.19 \(25 May 2007\)"](#). Also included are most (but not all) bugfixes made in the MCCGE 6.1.x series through MySQL 5.1.15-ndb-6.1.16.

This release fixes the following bugs:

- When restarting a data node, queries could hang during that node's start phase 5, and only continue once the node entered phase 6. ([Bug#29364](#))
- Replica redo logs were inconsistently handled during a system restart. ([Bug#29354](#))
- Batching of transactions was not handled correctly in some cases. ([Bug#29525](#))
- **Disk Data:** Disk data meta-information that existed in `ndb` might not be visible to `mysqld`. ([Bug#28720](#))
- **Disk Data:** The number of free extents was incorrectly reported for some tablespaces. ([Bug#28642](#))
- **Disk Data:** Performing Disk Data schema operations during a node restart could cause forced shutdowns of other data nodes. ([Bug#29501](#))

C.1.7.4. Changes in release MySQL 5.1.19-ndb-6.2.3-beta (02 July 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, "MySQL Installation Using a Source Distribution"](#), and in [Section 16.4.1, "Building MySQL Cluster from Source Code"](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.19-ndb-6.2.3. The file `mysqlcom-5.1.19-ndb-6.2.3-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.1 and MySQL 5.1.18-ndb-6.2.2 (see [Section C.1.9, "Changes in MySQL 5.1.18 Carrier Grade Edition"](#)), as well as all bugfixes and feature changes which were added in the mainline 5.1.19 release; information about these can be found in [Section C.1.6, "Changes in release 5.1.19 \(25 May 2007\)"](#). Also included are most (but not all) bugfixes made in the MCCGE 6.1.x series through MySQL 5.1.15-ndb-6.1.16.

Functionality added or changed:

- Backup reporting functionality has been significantly enhanced in this release:
 - A new configuration parameter `BackupReportFrequency` now makes it possible to cause the management client to provide status reports at regular intervals as well as for such reports to be written to the cluster log (depending on cluster event logging levels). See [Section 16.4.4.5, "Defining Data Nodes"](#), for more information about this parameter.
 - A new `REPORT BackupStatus` command has been added in the cluster management client which allows you to obtain a backup status report at any time during a backup. For more about this command, see [Section 16.7.2, "Commands in the MySQL Cluster Management Client"](#).
 - `ndb_restore` now provides running reports of its progress when restoring a backup. In addition, a complete report status report on the backup is written to the cluster log.

- A new memory allocator has been implemented for the **NDB** kernel, which allocates memory to tables 32K page by 32K page rather than allocating it in variable-sized chunks as previously. This removes much of the memory overhead that was associated with the old memory allocator.
- A new **NdbRecord** object has been added to the **NDB** API. This object provides mapping to a record stored in **NDB**.
- Read ahead was implemented for backups of Disk Data tables, resulting in a 10 to 15% increase in backup speed of Disk Data tables. (Bug#29099)
- Batching of updates on cluster replication slaves, enabled using the `--slave-allow-batching` option for **mysqld**. See [Section 16.10.6, “Starting Replication \(Single Replication Channel\)”](#), for more information.
- A new configuration parameter **ODirect** causes **NDB** to attempt using **O_DIRECT** writes for LCP, backups, and redo logs, often lowering CPU usage.

This release fixes the following bugs:

- Setting **MaxNoOfTables** very low and relative to **DataMemory** caused **OUT OF MEMORY IN NDB KERNEL** errors when inserting relatively small amounts of data into **NDB** tables. (Bug#24173)
- The actual value of **MaxNoOfOpenFiles** as used by the cluster was offset by 1 from the value set in **config.ini**. This meant that setting **InitialNoOfOpenFiles** to the same value always caused an error. (Bug#28749)
- **Cluster Replication:** When replicating **MyISAM** or **InnoDB** tables to a MySQL Cluster, it was not possible to determine exactly what had been applied following a shutdown of the slave cluster or **mysqld** process. (Bug#26783)
- **Cluster APIs:** An invalid error code could be set on transaction objects by **BLOB** handling code. (Bug#28724)
- It is now possible to set the maximum size of the allocation unit for table memory using the **MaxAllocate** configuration parameter. (Bug#29044)
- **Cluster APIs:** The timeout set using the MGM API **ndb_mgm_set_timeout()** function was incorrectly interpreted as seconds rather than as milliseconds. (Bug#29063)
- **ndb_error_reporter** now preserves timestamps on files. (Bug#29074)
- Attempting to restore a **NULL** row to a **VARBINARY** column caused **ndb_restore** to fail. (Bug#29103)
- **auto_increment_increment** and **auto_increment_offset** are now supported for **NDB** tables. (Bug#26342)
- When shutting down **mysqld**, the **NDB** binlog process was not shut down before log cleanup began. (Bug#28949)
- The management client's response to **START BACKUP WAIT COMPLETED** did not include the backup ID. (Bug#27640)
- A query having a large **IN(...)** or **NOT IN(...)** list in the **WHERE** condition on an **NDB** table could cause **mysqld** to crash. (Bug#29185)
- **UPDATE IGNORE** statements involving the primary keys of multiple tables could result in data corruption. (Bug#28719)
- When a node failed to respond to a **COPY_GCI** signal as part of a global checkpoint, the master node was killed instead of the node that actually failed. (Bug#29331)
- If at least 2 files were involved in **REDO** invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. (Bug#29057)
- The wrong data pages were sometimes invalidated following a global checkpoint. (Bug#29067)
- An invalid comparison made during **REDO** validation that could lead to an **ERROR WHILE READING REDO LOG** condition. (Bug#29118)
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. (Bug#29176)

- Memory corruption could occur due to a problem in the `DBTUP` kernel block. (Bug#29229)
- The `NDB` transporter would hang when more than 1024 signals were received at one time. (Bug#28443)
- Having large amounts of memory locked caused swapping to disk. (Bug#28751)
- It was not possible to set a separate watchdog timeout at startup. (Bug#28899)
- LCP files were not removed following an initial system restart. (Bug#28726)
- **Disk Data:** Repeated `INSERT` and `DELETE` operations on a Disk Data table having one or more large `VARCHAR` columns could cause data nodes to fail. (Bug#20612)
- A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
- A race condition could occur between `NODE_FAILREP` and `COPY_GCIREQ` events. (Bug#28717)
- While loading data to the cluster after a version upgrade, the data nodes failed due to `ndbrequire` failures in `PGMAN`. (Bug#28525)
- A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. (Bug#28749)
- In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `P0.sysfile` files, `QMGR` could refuse to start, issuing an invalid `INSUFFICIENT NODES FOR RESTART` error instead. (Bug#29167)
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. (Bug#29176)

C.1.8. Changes in release 5.1.18 (08 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** The `INFORMATION_SCHEMA.EVENTS` and `mysql.event` tables have been changed to facilitate replication of events. When upgrading to MySQL 5.1.18, you must run `mysql_upgrade` prior to working with events. Until you have done so, any statement relating to the Event Scheduler or these tables (including `SHOW EVENTS`) will fail with the errors `EXPECTED FIELD STATUS AT POSITION 12 TO HAVE TYPE ENUM ( 'ENABLED', 'SLAVESIDE_DISABLED', 'DISABLED' ), FOUND ENUM( 'ENABLED', 'DISABLED' )` and `TABLE MYSQL.EVENT IS DAMAGED. CAN NOT OPEN`.

These changes were made as part of fixes for the following bugs:

- The effects of scheduled events were not replicated (that is, binary logging of scheduled events did not work). (Bug#16421, Bug#17857)
- Effects of scheduled events on a replication master were both replicated and executed on the slave, causing double execution of events. (Bug#20384)
- `CREATE FUNCTION` statements and their effects were not replicated correctly. (Bug#17671)

For more information, see [Section 15.3.1.5, “Replication of Invoked Features”](#).

Important

When upgrading to MySQL 5.1.18 or later from a previous MySQL version and scheduled events have been used, the upgrade utilities do not accommodate changes in event-related system tables. As a workaround, you can dump events before the upgrade, then restore them from the dump afterwards. This issue was fixed in MySQL 5.1.20 (see [Bug#28521](#)).

- Prior to this release, when `DATE` values were compared with `DATETIME` values the time portion of the `DATETIME` value was ignored. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as “00:00:00”. To mimic the old behavior use the `CAST()` function in the following way: `SELECT date_field = CAST(NOW() as DATE);`. ([Bug#28929](#))
- `mysqld_multi` now understands the `--no-defaults`, `--defaults-file`, and `--defaults-extra-file` options. The `--config-file` option is deprecated; if given, it is treated like `--defaults-extra-file`. ([Bug#27390](#))
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. ([Bug#25946](#))
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.1.
- Renamed the `old_mode` system variable to `old`.
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. ([Bug#25309](#))
- Added a `MASTER_SSL_VERIFY_SERVER_CERT` option for the `CHANGE MASTER` statement, and a `Master_SSL_Verify_Server_Cert` output column to the `SHOW SLAVE STATUS` statement. The option value also is written to the `master.info` file. ([Bug#19991](#))
- **NDB Cluster (APIs):** The MGM API now supports explicit setting of network timeouts using the `ndb_mgm_set_timeout()` function. A utility function `ndb_mgm_number_of_mgmd_in_connect_string()` is also implemented to facilitate calculation of timeouts based on the number of management servers in the cluster.

For more information, see `ndb_mgm_set_timeout()`, and `ndb_mgm_number_of_mgmd_in_connect_string()`.

- **NDB Cluster:** The behavior of the `ndb_restore` utility has been changed as follows:
 - It is now possible to restore selected databases or tables using `ndb_restore`. ([Bug#26899](#))
 - Several options have been added for use with `ndb_restore --print-data` to facilitate the creation of structured data dump files. These options can be used to make dumps made using `ndb_restore` more like those produced by `mysqldump`. ([Bug#26900](#))

For details of these changes, see [Section 16.8.3, “ndb_restore — Restore a Cluster Backup”](#).

- **NDB Cluster (Replication)/Incompatible Change:** The definition of the `mysql.ndb_apply_status` table has changed such that an online upgrade is not possible from MySQL 5.1.17 or earlier for a replication slave cluster; you must shut down all SQL nodes as part of the upgrade procedure. See [Section 16.5.2, “Cluster Upgrade and Downgrade Compatibility”](#) before upgrading for details.

For more information about the changes to `mysql.ndb_apply_status` see [Section 16.10.4, “Cluster Replication Schema and Tables”](#).

- **NDB Cluster (Replication):** Some circular replication setups are now supported for MySQL Cluster. See [Section 16.10.3, “Known Issues in MySQL Cluster Replication”](#), for detailed information. ([Bug#25688](#), [Bug#17095](#))
- **NDB Cluster:** The following changes were made for the `ndb_size.pl` utility:
 - When `ndb_size.pl` calculates a value for a given configuration parameter that is less than the default value, it now suggests the default value instead. ([Bug#24227](#))
 - The dependency on `HTML:Template` was removed. ([Bug#24228](#))
- Several additional data types are supported for columns in `INFORMATION_SCHEMA` tables: `DATE`, `TIME`, `BLOB`, `FLOAT`, and all integer types. ([Bug#27047](#))
- **NDB Cluster:** The internal specifications for columns in `NDB` tables has changed to allow compatibility with future MySQL

Cluster releases that are expected to implement online adding and dropping of columns. This change is not backwards compatible with earlier MySQL versions.

See [the related note](#) in [Section 16.5.2, “Cluster Upgrade and Downgrade Compatibility”](#), for important information prior to upgrading a MySQL Cluster to MySQL 5.1.18 or later from MySQL 5.1.17 or earlier.

See also [Bug#28205](#).

- If a set function *S* with an outer reference *S(outer_ref)* cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets *S(outer_ref)* the same way that it would interpret *S(const)*. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the [ANSI SQL](#) mode is enabled. ([Bug#27348](#))
- Added `--write-binlog` option for `mysqlcheck`. This option is enabled by default, but can be given as `--skip-write-binlog` to cause `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements generated by `mysqlcheck` not to be written to the binary log. ([Bug#26262](#))
- The plugin interface and its handling of system variables was changed. Command-line options such as `--skip-innodb` now cause an error if `InnoDB` is not built-in or plugin-loaded. You should use `--loose-skip-innodb` if you do not want any error even if `InnoDB` is not available. The `--loose` prefix modifier should be used for all command-line options where you are uncertain whether the plugin exists and when you want the operation to proceed even if the option is necessarily ignored due to the absence of the plugin. (For a description of how `--loose` works, see [Section 4.3.1, “Using Options on the Command Line”](#).)
- New command-line options: To alleviate ambiguities in variable names, all variables related to plugins can be specified using a `plugin` part in the name. For example, every time where we used to have `innodb` in the command-line options, you can now write `plugin-innodb`:

```
--skip-plugin-innodb
--plugin-innodb-buffer-pool-size=#
```

Furthermore, this is the preferred syntax. It helps to avoid ambiguities when a plugin, say, `wait`, has an option called `timeout`. `--wait-timeout` will still set a system variable, but `--plugin-wait-timeout` will set the plugin variable. Also, there is a new command-line option `--plugin-load` to install or load plugins at initialization time without using the `mysql.plugin` table.

- Storage engine plugins may now be uninstalled at run time. However, a plugin is not actually uninstalled until after its reference count drops to zero. The `default_storage_engine` system variable consumes a reference count, so uninstalling will not complete until said reference is removed.

Bugs fixed:

- **Security fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. ([CVE-2007-2692](#), [Bug#27337](#))
- **Security fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not being enforced. ([CVE-2007-2691](#), [Bug#27515](#))
- **Security fix:** A user with only the `ALTER` privilege on a partitioned table could obtain information about the table that should require the `SELECT` privilege. ([CVE-2007-2693](#), [Bug#23675](#))
- The patches for [Bug#19370](#) and [Bug#21789](#) were reverted.
- **NDB Cluster** (Disk Data): Creating an excessive number of Disk Data tables (1000 or more) could cause data nodes to fail. ([Bug#24951](#))
- **NDB Cluster:** When a cluster node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the “vanished” node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. ([Bug#24793](#))
- **NDB Cluster:** Under certain rare circumstances, `ndbd` could get caught in an infinite loop when one transaction took a read lock and then a second transaction attempted to obtain a write lock on the same tuple in the lock queue. ([Bug#28073](#))
- **NDB Cluster:** Under some circumstances, a node restart could fail to update the Global Checkpoint Index (GCI). ([Bug#28023](#))
- **NDB Cluster** (Disk Data): It was possible to drop the last remaining datafile in a tablespace (using an `ALTER TABLESPACE`

statement), even though there was still an empty table using the tablespace. ([Bug#21699](#))

It should be noted that the datafile could be not dropped if the table still contained any rows, so this bug involved no loss of data.

- **NDB Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. ([Bug#27980](#))
- **NDB Cluster:** The name of the month “March” was given incorrectly in the cluster error log. ([Bug#27926](#))
- **NDB Cluster** (Cluster Replication / Disk Data): An issue with replication of Disk Data tables could in some cases lead to node failure. ([Bug#28161](#))
- **NDB Cluster** (APIs): For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The **NDB** API methods affected by this problem included the following:
 - `NdbOperation::readTuple()`
 - `NdbScanOperation::readTuples()`
 - `NdbIndexScanOperation::readTuples()` ([Bug#27320](#))
- **NDB Cluster** (Disk Data): Setting the value of the `UNDO BUFFER SIZE` to 64K or less in a `CREATE LOGFILE GROUP` statement led to failure of cluster data nodes. ([Bug#24560](#))
- **NDB Cluster:** The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. ([Bug#28093](#))
- **NDB Cluster:** It was not possible to add a unique index to an **NDB** table while in single user mode. ([Bug#27710](#))
- **NDB Cluster:** Performing a delete followed by an insert during a local checkpoint could cause a `ROWID ALREADY ALLOCATED` error. ([Bug#27205](#))
- **NDB Cluster** (Disk Data): When restarting a data node following the creation of a large number (~200) of Disk Data objects, the cluster could not assign a node ID to the restarting node. ([Bug#25741](#))
- **NDB Cluster:** Adding of indexes online failed for **NDB** tables having `BLOB` or `TEXT` columns. ([Bug#25431](#))
- **NDB Cluster:** The `ndb_resize.pl` utility did not calculate memory usage for indexes correctly. ([Bug#24229](#))
- **NDB Cluster:** While a data node was stopped, dropping a table then creating an index on a different table caused that node to fail during restart. This was due to the re-use of the dropped table's internal ID for the index without verifying that the index now referred to a different database object. ([Bug#21755](#))
- **NDB Cluster** (Disk Data): When in single user mode, it was possible to create log file groups and tablespaces from any SQL node connected to the cluster. ([Bug#27712](#))
- **NDB Cluster** (Disk Data): Changing a column specification or issuing a `TRUNCATE` statement on a Disk Data table caused the table to become an in-memory table. ([Bug#24667](#), [Bug#25296](#))

This fix supersedes an incomplete fix that was made for this issue in MySQL 5.1.15.

- **NDB Cluster** (Replication): Setting `SQL_LOG_BIN` to zero did not disable binary logging. ([Bug#27076](#))

This issue affected only the **NDB** storage engine.

- **NDB Cluster** (Replication): It was possible for API nodes to begin interacting with the cluster subscription manager before they were fully connected to the cluster. ([Bug#27728](#))
- **NDB Cluster** (Replication): Under very high loads, checkpoints could be read or written with checkpoint indexes out of order. ([Bug#27651](#))
- **NDB Cluster:** **NDB** tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. ([Bug#27775](#))
- **NDB Cluster:** **NDB** tables with indexes whose names contained space characters were not restored correctly by `ndb_restore`

(the index names were truncated). (Bug#27758)

- **NDB Cluster** (Disk Data): Changes to a Disk Data table made as part of a transaction could not be seen by the client performing the changes until the transaction had been committed. (Bug#27757)
- **NDB Cluster**: An **INSERT** followed a delete **DELETE** on the same **NDB** table caused a memory leak. (Bug#27756)
(This bug was introduced by the fix for Bug#20612.)
- **NDB Cluster**: Some queries that updated multiple tables were not backed up or replicated correctly. (Bug#27748)
- **NDB Cluster**: Joins on multiple tables containing **BLOB** columns could cause data nodes run out of memory, and to crash with the error **NDBOBJECTIDMAP::EXPAND UNABLE TO EXPAND**. (Bug#26176)
- **NDB Cluster**: When trying to create an **NDB** table after the server was started with **--ndbcluster** but without **--ndb-connectstring**, **mysqld** produced a memory allocation error. (Bug#27359)
- **NDB Cluster** (APIs): Using **NdbBlob::writeData()** to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
- **NDB Cluster** (Replication): Trying to replicate a large number of frequent updates with a relatively small relay log (**max-relay-log-size** set to 1M or less) could cause the slave to crash. (Bug#27529)
- **NDB Cluster** (Replication): An SQL node acting as a replication master server could be a single point of failure; that is, if it failed, the replication slave had no way of knowing this, which could result in a mismatch of data between the master and the slave. (Bug#21494)
- **NDB Cluster** (Disk Data): **CREATE TABLE ... LIKE disk_data_table** created an in-memory **NDB** table. (Bug#25875)
- **NDB Cluster** (Disk Data): Creating an excessive number of data files for a single tablespace caused data nodes to crash. (Bug#24521)
- **NDB Cluster**: Under certain rare circumstances, **DROP TABLE** or **TRUNCATE** of an **NDB** table could cause a node failure or forced cluster shutdown. (Bug#27581)
- **NDB Cluster**: Memory usage of a **mysqld** process grew even while idle. (Bug#27560)
- **NDB Cluster**: Using more than 16GB for **DataMemory** caused problems with variable-size columns. (Bug#27512)
- **NDB Cluster**: In an **NDB** table having a **TIMESTAMP** column using **DEFAULT CURRENT_TIMESTAMP**, that column would assume a random value when another column in the same row was updated. (Bug#27127)
- **NDB Cluster**: Performing **ALTER TABLE ... ENGINE=MERGE** on an **NDB** table caused **mysqld** to crash. (Bug#26898)
- **NDB Cluster**: The Cluster table handler did not set bits in null bytes correctly. (Bug#26591)
- **NDB Cluster**: In some cases, **AFTER UPDATE** and **AFTER DELETE** triggers on **NDB** tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be **UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE c4 = val2)** where there was an **AFTER UPDATE** trigger on table **tbl1**. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an **AFTER** trigger defined for this operation. (Bug#26242)

- **NDB Cluster**: **START BACKUP NOWAIT** caused a spurious **OUT OF BACKUP RECORD** error in the management client (**START BACKUP** and **START BACKUP WAIT STARTED** performed normally). (Bug#25446)
- **NDB Cluster**: When trying to create tables on an SQL node not connected to the cluster, a misleading error message **TABLE 'TBL_NAME' ALREADY EXISTS** was generated. The error now generated is **COULD NOT CONNECT TO STORAGE ENGINE**. (Bug#18676)

- **NDB Cluster**: A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. ([Bug#27466](#))
- **NDB Cluster**: When using the **MemReportFrequency** configuration parameter to generate periodic reports of memory usage in the cluster log, **DataMemory** usage was not always reported for all data nodes. ([Bug#27444](#))
- **NDB Cluster**: Error messages displayed when running in single user mode were inconsistent. ([Bug#27021](#))
- **NDB Cluster**: On Solaris, the value of an **NDB** table column declared as **BIT (33)** was always displayed as **0**. ([Bug#26986](#))
- **NDB Cluster** (Replication): An **UPDATE** on the master became a **DELETE** on slaves. ([Bug#27378](#))
- During a call to **mysql_change_user()**, when authentication fails or the database to change to is unknown, a subsequent call to any function that does network communication leads to packets out of order. This problem was introduced in MySQL 5.1.14. ([Bug#25371](#))
- **ON DUPLICATE KEY UPDATE** failed for a table partitioned by **KEY** on a primary key **VARCHAR** column. ([Bug#27123](#))
- The fix for [Bug#17212](#) provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. ([Bug#27531](#))
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. ([Bug#25621](#))
- **SELECT COUNT(*)** from a table containing a **DATETIME NOT NULL** column could produce spurious warnings with the **NO_ZERO_DATE** SQL mode enabled. ([Bug#22824](#))
- Nested aggregate functions could be improperly evaluated. ([Bug#27363](#))
- Using **CAST()** to convert **DATETIME** values to numeric values did not work. ([Bug#23656](#))
- Early **NULL**-filtering optimization did not work for **eq_ref** table access. ([Bug#27939](#))
- Non-grouped columns were allowed by ***** in **ONLY_FULL_GROUP_BY** SQL mode. ([Bug#27874](#))
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. ([Bug#27811](#))
- An error message suggested the use of **mysql_fix_privilege_tables** after an upgrade, but the recommended program is now **mysql_upgrade**. ([Bug#27818](#))
- **mysqld** did not check the length of option values and could crash with a buffer overflow for long values. ([Bug#27715](#))
- Index hints (**USE INDEX**, **IGNORE INDEX**, **FORCE INDEX**) cannot be used with **FULLTEXT** indexes, but were not being ignored. ([Bug#25951](#))
- **mysql_upgrade** did not detect failure of external commands that it runs. ([Bug#26639](#))
- **mysql_upgrade** did not pass a password to **mysqlcheck** if one was given. ([Bug#25452](#))
- On Windows, **mysql_upgrade** was sensitive to lettercase of the names of some required components. ([Bug#25405](#))
- The result set of a query that used **WITH ROLLUP** and **DISTINCT** could lack some rollup rows (rows with **NULL** values for grouping attributes) if the **GROUP BY** list contained constant expressions. ([Bug#24856](#))
- Some upgrade problems are detected and better error messages suggesting that **mysql_upgrade** be run are produced. ([Bug#24248](#))
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. ([Bug#28188](#))
- The **LEAST()** and **GREATEST()** functions compared **DATE** and **DATETIME** values as strings, which in some cases could lead to an incorrect result. ([Bug#27759](#))
- **SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.schemata** failed with an **Access denied** error, even for a user who has the **FILE** privilege. ([Bug#28181](#))

- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug#27807)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an InnoDB table unique index using key column prefixes with an underlying `utf8` string column. (Bug#13191)
- On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmpdir` was a directory name containing any uppercase letters. (Bug#27653)
- A slave that used `--master-ssl-cipher` could not connect to the master. (Bug#21611)
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. (Bug#27293)
- Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
- For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
- Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug#27590)
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug#22364)
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the filesystem level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
- For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug#27650)
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug#27783)
- Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. (Bug#27322)
- Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted statement. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug#26551)
- The `AUTO_INCREMENT` value would not be correctly reported for InnoDB tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
- Creating a temporary table with InnoDB when using the one-file-per-table setting, when the host filesystem for temporary tables is `tmpfs` would cause an assertion in `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug#26662)
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. (Bug#27516)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug#27456)
- `mysqldump` could not connect using SSL. (Bug#27669)
- `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug#21765)

- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bugfix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- Comparisons using row constructors could fail for rows containing `NULL` values. (Bug#27704)
- Performing a `UNION` on two views that had had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug#27786)
- The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) (Bug#27530)
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. (Bug#27499)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug#26817)
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug#20095)
- The server did not shut down cleanly. (Bug#27310)
- Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. (Bug#22648)
- The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug#27608)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug#26624)
- `mysqlbinlog` produced different output with the `-R` option than without it. (Bug#27171)
- A stored function invocation in the `WHERE` clause was treated as a constant. (Bug#27354)
- `mysqldump` could not dump the log tables. (Bug#26121)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug#27870)
- A memory leak in the event scheduler that was uncovered by Valgrind was fixed. (Bug#27733)
- For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
- Group relay log rotation updated only the log position and not the name, causing the slave to stop. (Bug#27583)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuuu`) value. (Bug#16546)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug#27484)
- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug#27659)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug#27321)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. (Bug#26815)
- For `InnoDB`, fixed consistent-read behavior of the first read statement, if the read was served from the query cache, for the `READ COMMITTED` isolation level. (Bug#21409)
- The binary log incompatibility introduced by the fix for Bug#22583 was corrected. (Bug#27779)
- Row-based replication of `MyISAM` to non-`MyISAM` tables did not work correctly for `BIT` columns. This has been corrected, but the fix introduces an incompatibility into the binary log format. (Bug#22583) (The incompatibility is corrected by the fix for

[Bug#27779](#).)

- Duplicate members in `SET` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. ([Bug#27069](#))
- If the name of a table given to `myisamchk -rq` was a packed table and the name included the `.MYI` extension, `myisamchk` incorrectly created a file with a `.MYI.MYI` extension. ([Bug#26782](#))
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. ([Bug#26207](#))
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. ([Bug#25494](#))
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. ([Bug#20376](#))
- The `FEDERATED` engine did not allow the local and remote tables to have different names. ([Bug#26257](#))
- The `NO_DIR_IN_CREATE` server SQL mode was not enforced for partitioned tables. ([Bug#24633](#))
- On Windows, trying to use backslash (`\`) characters in paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating partitioned tables caused MySQL to crash. ([Bug#25141](#), [Bug#26074](#))

(You must use `/` characters when specifying paths for these options, regardless of platform. See [Section 17.1, “Overview of Partitioning in MySQL”](#), for an example using absolute paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating a partitioned table on Windows.)
- A damaged or missing `mysql.event` table caused `SHOW VARIABLES` to fail. ([Bug#23631](#))
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were being truncated to 64 bytes. ([Bug#21432](#))
- If a rotate event occurred in the middle of a non-transaction group, the group position would be updated by the rotate event indicating an illegal group start position that was effectively inside a group. This can happen if, for example, a rotate occurs between an `In-tvar` event and the associated `Query` event, or between the table map events and the rows events when using row-based replication. ([Bug#23171](#))
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `-fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. ([Bug#26346](#))
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. ([Bug#25927](#))
- The values displayed for the `Innodb_row_lock_time`, `Innodb_row_lock_time_avg`, and `Innodb_row_lock_time_max` status variables were incorrect. ([Bug#23666](#))
- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. ([Bug#21976](#))
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. ([Bug#27586](#))
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. ([Bug#27532](#))
- For the `INFORMATION_SCHEMA.SESSION_STATUS` and `GLOBAL_STATUS` tables, some status values were incorrectly converted to the data type of the `VARIABLE_VALUE` column. ([Bug#27327](#))
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. ([Bug#27257](#))
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` caused a server crash. ([Bug#27229](#))
- Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. ([Bug#25082](#))
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). ([Bug#26359](#),

[Bug#27176](#))

- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. ([Bug#27490](#))
- The temporary file-creation code was cleaned up on Windows to improve server stability. ([Bug#26233](#))
- Out-of-memory errors were not reported. Now they are written to the error log. ([Bug#26844](#))
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. ([Bug#25993](#))
- Corrupted `MyISAM` tables that have different definitions in the `.frm` and `.MYI` tables might cause a server crash. ([Bug#25908](#))
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. ([Bug#25729](#))
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. ([Bug#25521](#))
- `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. ([Bug#25482](#))
- `MBROverlaps()` returned incorrect values in some cases. ([Bug#24563](#))
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. ([Bug#24484](#))
- Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. ([Bug#26837](#))
- `MBRDisjoint()`, `MBRequal()`, `MBRIntersects()`, `MBROverlaps()`, `MBRTouches()`, and `MBRWithin()` were inadvertently omitted from recent versions of MySQL (5.1.14 to 5.1.17). ([Bug#24563](#))
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. ([Bug#23491](#))
- When MySQL logged slow query information to a `CSV` table, it used an incorrect formula to calculate the `query_time` and `lock_time` values. ([Bug#27638](#))
- With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a non-existent database caused the server to exit. ([Bug#27381](#))
- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. ([Bug#27022](#))
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. ([Bug#26835](#))
- `make_win_bin_dist` neglected to copy some required `MyISAM` table files. ([Bug#26922](#))
- Fixed a possible buffer overflow in `SHOW PROCEDURE CODE`. ([Bug#26303](#))
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. ([Bug#24791](#))
- Access via `my_pread()` or `my_pwrite()` to table files larger than 2GB could fail on some systems. ([Bug#24566](#))
- An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. ([Bug#23345](#))
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. ([Bug#24985](#))
- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (`' '`). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. ([Bug#26231](#))
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether

`col_name` was a valid column in the table. ([Bug#26186](#))

- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. ([Bug#26813](#))
- `mysqlbinlog --base64-output` produced invalid SQL. ([Bug#26194](#))
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. ([Bug#27300](#))
- Some views could not be created even when the user had the requisite privileges. ([Bug#24040](#))
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. ([Bug#23233](#))
- Executing an `INSERT ... SELECT ... FROM INFORMATION_SCHEMA.GLOBAL_STATUS` statement from within an event caused a server crash. ([Bug#26174](#))
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. ([Bug#9504](#))
- When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. ([Bug#25543](#))
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. ([Bug#22638](#))
- Row equalities in `WHERE` clauses could cause memory corruption. ([Bug#27154](#))
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. ([Bug#27079](#))
- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. ([CVE-2007-2583](#)) ([Bug#27362](#), [Bug#27513](#))
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. ([Bug#27164](#))
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. ([Bug#25492](#))
- For `FEDERATED` tables, `SHOW CREATE TABLE` could fail when the table name was longer than the connection name. ([Bug#27036](#))
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. ([Bug#26996](#))
- The range optimizer could cause the server to run out of memory. ([Bug#26625](#))
- `CREATE SERVER`, `DROP SERVER`, and `ALTER SERVER` did not require any privileges. Now these statements require the `SUPER` privilege. ([Bug#25671](#))
- Concurrent `CREATE SERVER` and `ALTER SERVER` statements could cause a deadlock. ([Bug#25721](#))
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. ([Bug#25289](#))

C.1.9. Changes in MySQL 5.1.18 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.18.

C.1.9.1. Changes in release MySQL 5.1.18-ndb-6.2.2-beta (07 May 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using

the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.18-ndb-6.2.2. The file `mysqlcom-5.1.18-ndb-6.2.2-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.16-ndb-6.2.0 and MySQL 5.1.18-ndb-6.2.1, which includes all bugfixes and feature changes which were added in the mainline 5.1.18 release; information about these can be found in [Section C.1.8, “Changes in release 5.1.18 \(08 May 2007\)”](#).

Functionality added or changed:

- Added a new `mysqld` option `--ndb-cluster-connection-pool` that allows a single MySQL server to use multiple connections to the cluster. This allows for scaling out using multiple MySQL clients per SQL node instead of or in addition to using multiple SQL nodes with the cluster.

For more information about this option, see the description in [Section 5.2.2, “Command Options”](#).

- New cluster management client `DUMP` commands were added to aid in tracking transactions, scan operations, and locks. See `DUMP 2350`, `DUMP 2352`, and `DUMP 2550`, for more information.

C.1.9.2. Changes in release MySQL 5.1.18-ndb-6.2.1-beta (Released 30 April 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Warning

This release was withdrawn after production and should no longer be used.

Like all releases for MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.16-ndb-6.2.0. The file `mysqlcom-5.1.16-ndb-6.2.0-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.18-ndb-6.2.0, which includes all bugfixes and feature changes which were added in the mainline 5.1.18 release; information about these can be found in [Section C.1.8, “Changes in release 5.1.18 \(08 May 2007\)”](#).

Important

Upgrading to MySQL 5.1.18-ndb-6.2.1 from a previous release. The internal specifications for columns in `NDB` tables changed to allow compatibility with future MySQL Cluster and MySQL Cluster 5.1 Carrier Grade Edition releases that are expected to implement online adding and dropping of columns. This change is not backwards compatible with MySQL 5.1.16-ndb-6.2.0, ndb-6.1.x versions prior to MySQL 5.1.15-ndb-6.1.7, or MySQL Cluster mainline releases prior to 5.1.18.

See the related note in [Section 16.5.2, “Cluster Upgrade and Downgrade Compatibility”](#), for important information prior to upgrading a MySQL Cluster to MySQL 5.1.15-ndb-6.1.7 or later from MySQL 5.1.15-ndb-6.1.6 or an earlier ndb-6.1.x release.

See also [Bug#28205](#).

This release fixes the following bugs:

- Multiple operations involving deletes followed by reads were not handled correctly. (Bug#28276)

Note

This issue could also affect MySQL Cluster Replication.

- **Cluster APIs:** Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
- **Cluster Replication:** Trying to replicate a large number of frequent updates with a relatively small relay log (`max-re-lay-log-size` set to 1M or less) could cause the slave to crash. (Bug#27529)
- **Cluster Replication:** An SQL node acting as a replication master server could be a single point of failure; that is, if it failed, the replication slave had no way of knowing this, which could result in a mismatch of data between the master and the slave. (Bug#21494)
- Memory usage of a `mysqld` process grew even while idle. (Bug#27560)
- The Cluster table handler did not set bits in null bytes correctly. (Bug#26591)
- When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#18676)
- Incorrect handling of fragmentation in a node takeover during a restart could cause stale data to be copied to the starting node, leading eventually to failure of the node. (Bug#27434)
- Incorrect handling of fragmentation in a node takeover during a restart could cause stale data to be copied to the starting node, leading eventually to failure of the node. (Bug#27434)
- After putting the cluster in single user mode from one MySQL server, trying to drop an NDB table from a second MySQL server also connected to the cluster would cause the second MySQL server to hang. (Bug#27254)
- `mysqld` could crash shortly after a data node failure following certain DML operations. (Bug#27169)
- An incorrect assertion was made when sending a `TCKEYFAILREF` or `TCKEYCONF` message to a failed data node. (Bug#26814)

C.1.10. Changes in release 5.1.17 (04 April 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** Scheduled events now use the MySQL server time zone to determine their schedules, rather than UTC as in previous releases. Because of this change, scheduled event metadata now includes time zone information, which can be seen in the `TIME_ZONE` column of the `INFORMATION_SCHEMA.EVENTS` table and the `Time zone` column in the output of the `SHOW EVENTS` statement. These columns have been added in this release, along with a `time_zone` column in the `mysql.event` table. Due to these changes, events created in previous versions of MySQL cannot be created, viewed, or used until `mysql.event` has been upgraded. (Bug#16420)
- **Important change:** The `CREATE EVENT` and `ALTER EVENT` statements now support a `DEFINER` clause, similar to that used in the `CREATE TRIGGER` statement. (Bug#16425)

See [Section 21.2.2, “CREATE EVENT Syntax”](#), for detailed information.

- **Important change:** The following options for controlling replication master configuration on a slave are now deprecated.

- `--master-host`
- `--master-user`
- `--master-password`
- `--master-port`
- `--master-connect-retry`
- `--master-ssl`
- `--master-ssl-ca`
- `--master-ssl-capath`
- `--master-ssl-cert`
- `--master-ssl-cipher`
- `--master-ssl-key`

To change the master configuration on a slave you should use the `CHANGE MASTER` statement. (See also #21490)

- Statements that affect `mysql` database tables now are written to the binary log using the following rules:
 - Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` system variable.
 - Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`.

For more details, see [Section 5.11.4.4, “Logging Format for Changes to `mysql` Database Tables”](#). (Bug#25091)

- Prepared statements now use the query cache under the conditions described in [Section 6.5.4.1, “How the Query Cache Operates”](#). (Bug#735)
- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug#18628)
- Added the `--service-startup-timeout` option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. (Bug#26952)
- Added the `innodb_stats_on_metadata` system variable to enable control over whether `InnoDB` performs statistics gathering when metadata statements are executed. See [Section 13.5.4, “InnoDB Startup Options and System Variables”](#). (Bug#26598)
- Added the `hostname` system variable, which the server sets at startup to the server hostname.
- The syntax for index hints has been extended to enable more fine-grained control over the optimizer's selection of an execution plan for various phases of query processing. See [Section 12.2.7.2, “Index Hint Syntax”](#). (Bug#21174)
- Added the `thread_handling` system variable to control whether the server use a single thread or one thread per connection. The `--one-thread` option now is deprecated; use `--thread_handling=one-thread` instead.
- Added the `old_mode` system variable to cause the server to revert to certain behaviors present in older versions. Currently, this variable affects handling of index hints. See [Section 12.2.7.2, “Index Hint Syntax”](#).
- **NDB Cluster:** Added the `--skip-table-check` option (short form `-s`) for `ndb_restore`, which causes the restoration process to ignore any changes that may have occurred in table schemas after the backup was made. Previously, this was the default behavior. (Bug#24363)

See [Section 16.8.3, “`ndb\_restore` — Restore a Cluster Backup”](#), for more information.

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got`

signal 11 messages). ([Bug#24878](#))

- Prefix lengths for columns in [SPATIAL](#) indexes no longer can be specified. For tables created in older versions of MySQL that have [SPATIAL](#) indexes containing prefixed columns, dumping and reloading the table causes the indexes to be created with no prefixes. (The full column width of each column is indexed.) ([Bug#26794](#))
- Added a `--no-beep` option to `mysqladmin`. It suppresses the warning beep that is emitted by default for errors such as a failure to connect to the server. ([Bug#26964](#))

Bugs fixed:

- **Important note:** The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser allowed a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

The parser now rejects this invalid construct, but if you upgrade in place (without dumping and reloading your databases), existing handlers that contain the construct still are invalid *even if they appear to function as you expect* and should be rewritten.

To find affected handlers, use `mysqldump` to dump all stored functions and procedures, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see [Section 19.2.8.2, “DECLARE Handlers”](#). ([Bug#26503](#))

- **Incompatible change:** [INSERT DELAYED](#) statements are not supported for [MERGE](#) tables, but the [MERGE](#) storage engine was not rejecting such statements, resulting in table corruption. Applications previously using [INSERT DELAYED](#) into [MERGE](#) table will break when upgrading to versions with this fix. To avoid the problem, remove [DELAYED](#) from such statements. ([Bug#26464](#))
- Creating a table on one SQL node while in single user mode caused other SQL nodes to crash. ([Bug#26997](#))
- [NDB Cluster](#): The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with [TINYINT](#) or [SMALLINT](#) columns. ([Bug#26740](#))
- [NDB Cluster](#): After putting the cluster in single user mode from one MySQL server, trying to drop an NDB table from a second MySQL server also connected to the cluster would cause the second MySQL server to hang. ([Bug#27254](#))
- [NDB Cluster](#) (Cluster APIs): You can now use the `ndb_mgm_check_connection()` function to determine whether a management server is running. See `ndb_mgm_check_connection()`.
- [NDB Cluster](#): `mysqld` could crash shortly after a data node failure following certain DML operations. ([Bug#27169](#))
- [NDB Cluster](#): The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node. ([Bug#21715](#))

Note

The [ALL STATUS](#) command in the cluster management client still displays status information for data nodes only. This is by design. See [Section 16.7.2, “Commands in the MySQL Cluster Management Client”](#), for more information.

- [NDB Cluster](#) (Cluster APIs): [NAND](#) and [NOR](#) operations with `NdbScanFilter` did not perform correctly. ([Bug#24568](#))
- [NDB Cluster](#) (Cluster Replication): The simultaneous failure of a data node and an SQL node could cause replication to fail. ([Bug#27005](#))
- [NDB Cluster](#) (Disk Data): Under some circumstances, a data node could fail during restart while flushing Disk Data UNDO logs. ([Bug#27102](#))
- [NDB Cluster](#) (Disk Data): Creating multiple Disk Data tables using different tablespaces could sometimes cause the cluster to fail. ([Bug#25992](#))
- [NDB Cluster](#) (Disk Data): `ALTER TABLE ... ADD COLUMN ...` on a Disk Data table moved data for existing non-indexed columns from the tablespace into memory. ([Bug#25880](#))
- [NDB Cluster](#) (Disk Data): `DROP INDEX` on a Disk Data table did not always move data from memory into the tablespace.

[Bug#25877](#))

- **NDB Cluster** (Disk Data): When creating a log file group, setting `INITIAL_SIZE` to less than `UNDO_BUFFER_SIZE` caused data nodes to crash. ([Bug#25743](#))
- **NDB Cluster**: It was not possible to set `LockPagesInMainMemory` equal to 0. ([Bug#27291](#))
- **NDB Cluster**: A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. ([Bug#27286](#))
- **NDB Cluster**: When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. ([Bug#27283](#))
- **NDB Cluster**: A delete operation using a scan following by an insert using a scan could cause a data node to fail. ([Bug#27203](#))
- **NDB Cluster**: The same failed request from an API node could be handled by the cluster multiple times, resulting in reduced performance. ([Bug#27087](#))
- **NDB Cluster**: The failure of a data node while restarting could cause other data nodes to hang or crash. ([Bug#27003](#))
- **NDB Cluster**: `mysqld` processes would sometimes crash under high load. ([Bug#26825](#))
- **NDB Cluster**: When performing an upgrade or downgrade, no specific error information was made available when trying to upgrade data nodes or SQL nodes before upgrading management nodes. ([Bug#21296](#))
- **NDB Cluster**: Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. ([Bug#19378](#))
- **NDB Cluster**: An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. ([Bug#26515](#))
- **NDB Cluster** (Disk Data): A memory overflow could occur with tables having a large amount of data stored on disk, or with queries using a very high degree of parallelism on Disk Data tables. ([Bug#26514](#))
- **NDB Cluster** (Disk Data): Use of a tablespace whose `INITIAL_SIZE` was greater than 1 GB could cause the cluster to crash. ([Bug#26487](#))
- **NDB Cluster**: Using only the `--print_data` option (and no other options) with `ndb_restore` caused `ndb_restore` to fail. ([Bug#26741](#))

This bug was introduced by the fix for [Bug#14612](#).

- **NDB Cluster**: An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. ([Bug#26720](#))
- While preparing prepared statements, the server acquired unnecessary table write locks. ([Bug#18326](#))
- For some operations, system tables in the `mysql` database must be accessed. For example, the `HELP` statement requires the contents of the server-side help tables, and `CONVERT_TZ()` might need to read the time zone tables. However, to perform such operations while a `LOCK TABLES` statement is in effect, the server required you to also lock the requisite system tables explicitly or a lock error occurred:

```
mysql> LOCK TABLE t1 READ;
Query OK, 0 rows affected (0.02 sec)
mysql> HELP HELP;
ERROR 1100 (HY000) at line 4: Table 'help_topic' was not
locked with LOCK TABLES
```

Now, the server implicitly locks the system tables for reading as necessary so that you need not lock them explicitly. These tables are treated as just described:

```
mysql.help_category
mysql.help_keyword
mysql.help_relation
mysql.help_topic
mysql.proc
mysql.time_zone
mysql.time_zone_leap_second
mysql.time_zone_name
mysql.time_zone_transition
```

mysql.time_zone_transition_type

If you want to explicitly place a **WRITE** lock on any of those tables with a **LOCK TABLES** statement, the table must be the only one locked; no other table can be locked with the same statement. (Bug#9953)

- For a stored procedure containing a **SELECT** statement that used a complicated join with an **ON** expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
- On Windows, debug builds of **mysqld** could fail with heap assertions. (Bug#25765)
- On Windows, debug builds of **mysqlbinlog** could fail with a memory error. (Bug#23736)
- **SELECT ... INTO OUTFILE** with a long **FIELDS ENCLOSED BY** value could crash the server. (Bug#27231)
- The server could hang during binary log rotation. (Bug#26079)
- Increasing the width of a **DECIMAL** column could cause column values to be changed. (Bug#24558)
- **DOUBLE** values such as **20070202191048.000000** were being treated as illegal arguments by **WEEK()**. (Bug#23616)
- Replication between master and slave would infinitely retry binary log transmission where the **max_allowed_packet** on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- Setting **event_scheduler=1** or **event_scheduler=ON** caused the server to crash if the server had been started with **--skip-grant-tables**. Starting the server with **--skip-grant-tables** now causes **event_scheduler** to be set to **DISABLED** automatically, overriding any other value that may have been set. (Bug#26807)
- **SHOW CREATE EVENT** failed to display the **STARTS** and **ENDS** clauses for an event defined with **STARTS NOW()**, **ENDS NOW()**, or both. (Bug#26429)
- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)
- For **INSERT ... ON DUPLICATE KEY UPDATE** statements on tables containing **AUTO_INCREMENT** columns, **LAST_INSERT_ID()** was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, **LAST_INSERT_ID()** should not be reset to 0. Now **LAST_INSERT_ID()** is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug#27033)

This bug was introduced by the fix for Bug#19978.

- An **INSERT ... ON DUPLICATE KEY UPDATE** statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus **ON DUPLICATE KEY UPDATE** very unreliable. (Bug#27006, Bug#27210)

This bug was introduced by the fix for Bug#19978.

- For **INSERT ... ON DUPLICATE KEY UPDATE** statements where some **AUTO_INCREMENT** values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the **AUTO_INCREMENT** column. (Bug#24432)

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version.

- For an **INSERT** statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an **ON DUPLICATE KEY UPDATE** clause, even if that clause was not used. (Bug#26261)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the **FROM** clause. (Bug#26738)
- When using the result of **SEC_TO_TIME()** for time value greater than 24 hours in an **ORDER BY** clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
- If the server was started with **--skip-grant-tables**, Selecting from **INFORMATION_SCHEMA** tables causes a server crash.

[Bug#26285](#))

- Adding **ORDER BY** clause to a query on an **InnoDB** table could cause the statement to return no result if the optimizer chose a covering index that enabled it to skip the **ORDER BY**. ([Bug#24778](#))
- **IN ((subquery))**, **IN (((subquery)))**, and so forth, are equivalent to **IN (subquery)**, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. ([Bug#21904](#))
- For **MERGE** tables defined on underlying tables that contained a short **VARCHAR** column (shorter than four characters), using **ALTER TABLE** on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the **MERGE** table, even if the **ALTER TABLE** did not change the definition. ([Bug#26881](#))
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. ([Bug#25966](#))
- **CURDATE()** is less than **NOW()**, either when comparing **CURDATE()** directly (**CURDATE() < NOW()** is true) or when casting **CURDATE()** to **DATE** (**CAST(CURDATE() AS DATE) < NOW()** is true). However, storing **CURDATE()** in a **DATE** column and comparing **col_name < NOW()** incorrectly yielded false. This is fixed by comparing a **DATE** column as **DATETIME** for comparisons to a **DATETIME** constant. ([Bug#21103](#))
- A view on a join is insertable for **INSERT** statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. ([Bug#25122](#))
- Expressions involving **SUM()**, when used in an **ORDER BY** clause, could lead to out-of-order results. ([Bug#25376](#))
- **LOAD DATA INFILE** sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. ([Bug#26050](#))
- Views that used a scalar correlated subquery returned incorrect results. ([Bug#26560](#))
- **IF(expr, unsigned_expr, unsigned_expr)** was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form **IS [NOT] {TRUE|FALSE}**, which were transformed internally into **IF()** expressions that evaluated to a signed result. ([Bug#24532](#))

For existing views that were defined using **IS [NOT] {TRUE|FALSE}** constructs, there is a related implication. The definitions of such views were stored using the **IF()** expression, not the original construct. This is manifest in that **SHOW CREATE VIEW** shows the transformed **IF()** expression, not the original one. Existing views will evaluate correctly after the fix, but if you want **SHOW CREATE VIEW** to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition.

- **BENCHMARK()** did not work correctly for expressions that produced a **DECIMAL** result. ([Bug#26093](#))
- For **MEMORY** tables, extending the length of a **VARCHAR** column with **ALTER TABLE** might result in an unusable table. ([Bug#26080](#))
- For some values of the position argument, the **INSERT()** function could insert a NUL byte into the result. ([Bug#26281](#))
- Creating a table with latin characters in the name caused the output of **SHOW FULL TABLES** to have **ERROR** for the table type. ([Bug#25081](#))
- Inserting **utf8** data into a **TEXT** column that used a single-byte character set could result in spurious warnings about truncated data. ([Bug#25815](#))
- **EXPLAIN EXTENDED** did not show **WHERE** conditions that were optimized away. ([Bug#22331](#))
- **INSERT DELAYED** statements inserted incorrect values into **BIT** columns. ([Bug#26238](#))
- For **expr IN(value_list)**, the result could be incorrect if **BIGINT UNSIGNED** values were used for **expr** or in the value list. ([Bug#19342](#))
- When a **TIME_FORMAT()** expression was used as a column in a **GROUP BY** clause, the expression result was truncated. ([Bug#20293](#))

- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug#25373)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. (Bug#25673)
- SSL connections failed on Windows. (Bug#26678)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and fixed support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
- `UNHEX() IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
- The `REPEAT()` function did not allow a column name as the `count` parameter. (Bug#25197)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug#25222)
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug#25126)
- `mysqlimport` used a variable of the wrong type for the `--use-threads` option, which could cause a crash on some architectures. (Bug#23814)
- A multiple-row delayed insert with an auto increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#25507, Bug#26116)
- Using `mysqlbinlog` on a binary log would crash if there were a large number of row-based events related to a single statement. (Bug#25628)
- Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)
- User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#20141, Bug#14914)
- Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)
- `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)
- `SHOW ENGINE MUTEX STATUS` failed to produce an `UNKNOWN TABLE ENGINE` error. (Bug#24392)
See [Section 12.5.4.13, “SHOW ENGINE Syntax”](#).
- MySQL would not compile when configured using `--without-query-cache`. (Bug#25075)
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. In addition, the creation of this and other MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#23669, Bug#20166)
- It was not possible to use XPath keywords as tag names for expressions used in the `ExtractValue()` function. (Bug#24747)

- **VIEW** restrictions were applied to **SELECT** statements after a **CREATE VIEW** statement failed, as though the **CREATE** had succeeded. (Bug#25897)
- An **INSERT** trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a **TABLE '...' DOESN'T EXIST** referring to the second table when attempting to delete records from the first table. (Bug#21825)
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug#25345)
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a **DROP TABLE** statement. (Bug#22580)
- When attempting to call a stored procedure creating a table from a trigger on a table **tbl** in a database **db**, the trigger failed with **ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST**. However, the actual reason that such a trigger fails is due to the fact that **CREATE TABLE** causes an implicit **COMMIT**, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with **ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER**, which makes clear the reason for the trigger's failure. (Bug#18914)
- Local variables in stored routines or triggers, when declared as the **BIT** type, were interpreted as strings. (Bug#12976)
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug#8407, Bug#20713)
- **NOW()** returned the wrong value in statements executed at server startup with the **--init-file** option. (Bug#23240)
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
- Setting the **slow_query_log_file** system variable caused log output to go to the general log, not the slow query log. (Bug#23225)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. (Bug#23527)
- The conditions checked by the optimizer to allow use of indexes in **IN** predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
- Several deficiencies in resolution of column names for **INSERT ... SELECT** statements were corrected. (Bug#25831)
- Indexes on **TEXT** columns were ignored when **ref** accesses were evaluated. (Bug#25971)
- The update columns for **INSERT ... SELECT ... ON DUPLICATE KEY UPDATE** could be assigned incorrect values if a temporary table was used to evaluate the **SELECT**. (Bug#16630)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug#24010)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug#23800)
- For index reads, the **BLACKHOLE** engine did not return end-of-file (which it must because **BLACKHOLE** tables contain no rows), causing some queries to crash. (Bug#19717)
- A query of type **index_merge**, and with a **WHERE** clause having the form **WHERE indexed_column_1=value_1 OR indexed_column_2=value_2** on a partitioned table caused the server to crash. (Bug#26117)

C.1.11. Changes in release 5.1.16 (26 February 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

■ Note

After release, a trigger failure problem was found to have been introduced. (Bug#27006) Users affected by this issue should upgrade to MySQL 5.1.17, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** `TRUNCATE TABLE` now requires the `DROP` privilege rather than the `DELETE` privilege. (Bug#23556).
- **NDB Cluster** (Cluster APIs) / **Incompatible change:** The `AbortOption` type is now a member of the `NdbOperation` class; its values and behavior have also changed. `NdbTransaction::AbortOption` can no longer be used, and applications written against the NDB API may need to be rewritten and recompiled to accomodate these changes. For more information about this change, see [The NdbOperation::AbortOption Type](#).

This also affects the behavior of the `NdbTransaction::execute()` method, which now reports failure only if the transaction was actually aborted. See [NdbTransaction::execute\(\)](#), for more information.

- **NDB Cluster:** A new configuration parameter `MemReportFrequency` allows for additional control of data node memory usage. Previously, only warnings at predetermined percentages of memory allocation were given; setting this parameter allows for that behavior to be overridden. For more information, see [Section 16.4.4.5, “Defining Data Nodes”](#).
- **NDB Cluster** (Cluster APIs): A new `ndb_mgm_get_cluster_log_loglevel()` function was added to the MGM API. For more information, see [ndb_mgm_get_cluster_log_loglevel\(\)](#).
- **NDB Cluster:** Previously, when a data node failed more than 8 times in succession to start, this caused a forced shutdown of the cluster. Now, when a data node fails to start 7 consecutive times, the node will not start again until it is started with the `-initial` option, and a warning to this effect is written to the error log. (Bug#25984)
- **NDB Cluster:** A number of new and more descriptive error messages covering transporter errors were added. (Bug#22025)
- **NDB Cluster:** In the event that all cluster management and API nodes are configured with `ArbitrationRank=0`, `ndb_mgmd` now issues the following warning when starting: `CLUSTER CONFIGURATION WARNING: NEITHER MGM NOR API NODES ARE CONFIGURED WITH ARBITRATOR, MAY CAUSE COMPLETE CLUSTER SHUTDOWN IN CASE OF HOST FAILURE.` (Bug#23546)
- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug#24496)

- In the `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` table, the `UNIQUE_CONSTRAINT_NAME` column incorrectly named the referenced table. Now it names the referenced constraint, and a new column, `REFERENCED_TABLE_NAME`, names the referenced table. (Bug#21713)
- `RAND()` now allows non-constant initializers (such as a column name) as its argument. In this case, the seed is initialized with the value for each invocation of `RAND()`. (One implication of this is that for equal argument values, `RAND()` will return the same value each time.) (Bug#6172)
- The bundled yaSSL library was upgraded to version 1.5.8.
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)

Bugs fixed:

- **Security fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash. (CVE-2007-1420, Bug#24630, Bug#26556) We would like to thank Oren Isacson from Flowgate Security Consulting as well as Stefan Streichsbier from SEC Consult for informing us about this problem.
- **NDB Cluster:** Condition pushdown did not work with prepared statements. (Bug#26225)
- **NDB Cluster** (APIs): After defining a delete operation using (`NdbOperation::deleteTuple()`) on a nonexistent primary

key of a table having a **BLOB** or **TEXT** column, invoking `NdbTransaction::execute()` caused the calling application to enter an endless loop rather than raising an error. (Bug#24028)

- **NDB Cluster**: An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- **NDB Cluster**: The **InvalidUndoBufferSize** error used the same error code (763) as the **IncompatibleVersions** error. **InvalidUndoBufferSize** now uses its own error code (779). (Bug#26490)
- **NDB Cluster**: Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug#26457)
- **NDB Cluster**: The `LockPagesInMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was 1, this could sometimes result in data node failure due to missed heartbeats. (Bug#26454)
- **NDB Cluster**: Under some circumstances, following the restart of a management, all cluster data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug#26293)
- **NDB Cluster**: An error was produced when `SHOW TABLE STATUS` was used on an **NDB** table that had no **AUTO_INCREMENT** column. (Bug#21033)

Note

This improves on and supersedes an earlier fix that was made for this issue in MySQL 5.1.12.

- **NDB Cluster**: When a node failed due to there being insufficient disk space to perform a local checkpoint, there was no indication that this was the source of the problem. Such a condition now produces an appropriate error message. (Bug#20121)
- **NDB Cluster** (Cluster APIs): `libndbclient.so` was not versioned. (Bug#13522)
- **NDB Cluster**: The `ndb_size.tmpl` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. (Bug#24191)
- **NDB Cluster** (Cluster APIs / Disk Data): A delete and a read performed in the same operation could cause one or more of the cluster's data nodes to crash. This could occur when the operation affected more than 5 columns concurrently, or when one or more of the columns was of the **VARCHAR** type and was stored on disk. (Bug#25794)
- **NDB Cluster** (Replication): The error message `LAST_ERRNO: 4294967295, ERROR IN WRITE_ROWS EVENT` now supplies a valid error code. (Bug#19896)
- **NDB Cluster** (Replication): Under some circumstances, the binlog thread could shut down while the slave SQL thread was still using it. (Bug#26015, Bug#26019)
- **NDB Cluster**: A query with an **IN** clause against an **NDB** table employing explicit user-defined partitioning did not always return all matching rows. (Bug#25821)
- A memory leak could cause problems during a node or cluster shutdown or failure. (Bug#25997)
- **NDB Cluster**: An appropriate error message was not provided when there was insufficient REDO log file space for the cluster to start. (Bug#25801)
- **NDB Cluster**: An **UPDATE** using an **IN** clause on an **NDB** table on which there was a trigger caused `mysqld` to crash. (Bug#25522)
- **NDB Cluster**: A memory allocation failure in the cluster Subscription Manager could cause the cluster to crash. (Bug#25239)
- **NDB Cluster**: In the event that cluster backup parameters such as `BackupWriteSize` were incorrectly set, no appropriate error was issued to indicate that this was the case. (Bug#19146)
- **OPTIMIZE TABLE** caused a race condition in the I/O cache. (Bug#19978)
- If the duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug#19978)

- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug#24035)
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. (Bug#25931)
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. (Bug#26209)
- Storing values specified as hexadecimal values 64 or more bits long into `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)
- `ISNULL( DATE( NULL ) )` and `ISNULL( CAST( NULL AS DATE ) )` erroneously returned false. (Bug#23938)
- If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug#10798)
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. (Bug#26017)
- For the `IF( )` and `COALESCE( )` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- The number of `setsockopt( )` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. (Bug#26124)
- `ORDER BY` on `DOUBLE` values could change the set of rows returned by a query. (Bug#19690)
- `LOAD DATA INFILE` did not work with pipes. (Bug#25807)
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. (Bug#26159)
- `ALTER TABLE` caused loss of `CASCADE` clauses for `InnoDB` tables. (Bug#24741)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE( )` caused a server crash. (Bug#23782)
- Use of already freed memory caused SSL connections to hang forever. (Bug#19209)
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug#25341)
- A yaSSL program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. (Bug#25417)
- `perror` crashed on some platforms due to failure to handle a `NULL` pointer. (Bug#25344)
- `mysql_kill( )` caused a server crash when used on an SSL connection. (Bug#25203)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug#19474)
- yaSSL was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug#25189)
- The `SEC_TO_TIME( )` and `QUARTER( )` functions sometimes did not handle `NULL` values correctly. (Bug#25643)

- The optimizer used a filesort rather than a `const` table read in some cases when the latter was possible. (Bug#16590)
- With `ONLY_FULL_GROUP_BY` enabled, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- Indexes disabled with `ALTER TABLE ... DISABLE KEYS` could in some cases be used by specifying `FORCE INDEX`. (Bug#20604)
- The arguments of the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. (Bug#25575)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug#24987)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a non-restricting `WHERE` are present. (Bug#17711)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug#25123)
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. (Bug#25580).
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. (Bug#23299).
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. (Bug#25407).
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. (Bug#25551).
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. (Bug#25044).
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. (Bug#23556).
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. (Bug#25530)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that return more than one row, no error was reported. If a query requires sorting by expressions containing single-row subselects that return more than one row, execution of the query may cause a server crash. (Bug#24653)
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. (Bug#25398)

- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug#25219)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug#25172)
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. (Bug#24776)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- A nested query on a partitioned table returned fewer records than on the corresponding non-partitioned table, when the subquery affected more than one partition. (Bug#24186)
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. (Bug#25382)

C.1.12. Changes in MySQL 5.1.16 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.16.

C.1.12.1. Changes in release MySQL 5.1.16-ndb-6.2.0-beta (03 March 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at [ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.16-ndb-6.2.0](http://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.16-ndb-6.2.0). The file `mysqlcom-5.1.16-ndb-6.2.0-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes which were added in MySQL 5.1.15-ndb-6.1.1 as well as in the mainline 5.1.16 release; information about these can be found in [Section C.1.14.19, “Changes in release MySQL 5.1.15-ndb-6.1.1-beta \(01 February 2007\)”](#), and in [Section C.1.11, “Changes in release 5.1.16 \(26 February 2007\)”](#).

Important

Upgrading to MySQL 5.1.16-ndb-6.2.0 from a previous release. This release is not binary compatible with previous MySQL MySQL Cluster 5.1 Carrier Grade Edition or mainline MySQL 5.1 releases. This means that:

- You cannot perform an online upgrade to this release from any of the MySQL MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.14 or MySQL 5.1.15, or from any of the mainline MySQL 5.1 releases. When upgrading from one of these versions, you must shut down the cluster, replace all binaries, then restart the cluster.
- You must recompile all NDB API and MGM API applications used with a previous version of MySQL Cluster, including those compiled against any of the MySQL MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.14 or MySQL 5.1.15.

Functionality added or changed:

- **Cluster APIs.** The `Ndb::startTransaction()` method now provides an alternative interface for starting a transaction. See [Ndb::startTransaction\(\)](#), for more information.
- **Cluster APIs.** New methods have been added to the `Ndb_cluster_connection` class to facilitate iterating over existing `Ndb` objects. See [ndb_cluster_connection::get_next_ndb_object\(\)](#), for more information.

- A new `TcpBind_INADDR_ANY` configuration parameter allows data nodes node to bind `INADDR_ANY` instead of a hostname or IP address in the `config.ini` file.
- A new `--ndb-wait-connected` option has been added for `mysqld`, which causes `mysqld` to wait for the specified amount of time to connect to the cluster before starting to accept MySQL client connections.
- Memory allocation has been improved on 32-bit architectures that enables using close to 3GB for `DataMemory` and `IndexMemory` combined.
- It is now possible to disable arbitration by setting `ArbitrationRank` equal to `0` on all nodes.

No new bugs were fixed in this release.

C.1.13. Changes in release 5.1.15 (25 January 2007)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** The following conditions apply to enabling the `read_only` system variable:
 - If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.
 - If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.
 - `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

Previously, the attempt to enable `read_only` would return immediately even if explicit locks or transactions were pending, so some data changes could occur for statements executing in the server at the same time. ([Bug#11733](#), [Bug#22009](#))

- **Incompatible change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. ([Bug#22646](#))

Important

When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement. Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.

Important

Previously, duplicate-key errors were indicated by the `ER_DUP_ENTRY` error code (1062). This code is no longer used. Instead, the server returns `ER_DUP_ENTRY_WITH_KEY_NAME` (1582), and the error message indicates the name of the index for which the duplicate occurred. Applications that test for duplicate keys should look for both error codes if they need to be compatible with current and older servers. (This change was reverted in MySQL 5.1.20; see [Bug#28842](#).)

- On Unix, when searching the standard locations for option files, MySQL programs now also look for `/etc/mysql/my.cnf` after checking for `/etc/my.cnf` and before checking the remaining locations. (Bug#25104)
- Remote servers for use with the `FEDERATED` storage engine now can be managed with the new `CREATE/ALTER/DROP SERVER` syntax.
- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug#18526)
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.
- Partitioning of tables using the `FEDERATED` storage engine is no longer permitted. Attempting to create such a table or to modify an existing table so that it uses both partitioning and `FEDERATED` now fails with an error. (Bug#22451)
- In MySQL 5.1, `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 4.1). (Bug#24200)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug#22958)
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)
- The default value of the `max_connections` variable has been increased to 151 in order that Websites running on Apache and using MySQL will not have more processes trying to access MySQL than the default number of connections available.

(The maximum number of Apache processes is determined by the Apache `MaxClient`, which defaults to 256, but is usually set to 150 in the `httpd.conf` commonly distributed with Apache. For more information about `MaxClient`, see http://httpd.apache.org/docs/2.2/mod/mpm_common.html#maxclients.)

(Bug#23883)
- The bundled `yaSSL` library was upgraded to version 1.5.0.
- Calling a non-deterministic stored routine when using statement-based replication now throws an error. Formerly, defining such a stored routine would cause an error to be thrown. (Bug#16456)
- The (undocumented) `UNIQUE_USERS()` and `GROUP_UNIQUE_USERS()` functions were removed. (Bug#22687)
- **NDB Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see `LockPagesInMainMemory`. (Bug#25686)

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release described in the section cited above.

Bugs fixed:

- **Incompatible change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing true `0xff` in their values: Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.1 older than 5.1.15 to version 5.1.15 or newer. (Bug#24660)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug#24780)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)

- Attempts to access a **MyISAM** table with a corrupt column definition caused a server crash. ([Bug#24401](#))
- **mysqltest_embedded** crashed at startup. ([Bug#25890](#))
- Accessing a fixed record format table with a crashed key definition results in server/**myisamchk** segmentation fault. ([Bug#24855](#))
- When opening a corrupted **.frm** file during a query, the server crashes. ([Bug#24358](#))
- If there was insufficient memory to store or update a blob record in a **MyISAM** table then the table will marked as crashed. ([Bug#23196](#))
- When updating a table that used a **JOIN** of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. ([Bug#21310](#))
- When **SET PASSWORD** was written to the binary log double quotes were included in the statement. If the slave was running in with the **sql_mode** set to **ANSI_QUOTES** the event would fail and halt the replication process. ([Bug#24158](#))
- Using **CREATE TABLE ... SELECT** and rolling back the transaction would leave an empty table on the master, but the instructions would not be recorded in the binary log and therefore replicated to the slave. This would result in a difference between the master and slave databases. An implicit commit has been added to ensure consistency. ([Bug#22865](#))
- When reading from the standard input on Windows, **mysqlbinlog** opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. ([Bug#23735](#))
- No warning was issued for use of the **DATA DIRECTORY** or **INDEX DIRECTORY** table options on a platform that does not support them. ([Bug#17498](#))
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. ([Bug#15518](#))
- **mysql_upgrade** failed when called with a **basedir** pathname containing spaces. ([Bug#22801](#))
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) ([Bug#24037](#))
- If there was insufficient memory available to **mysqld**, this could sometimes cause the server to hang during startup. ([Bug#24751](#))
- Using row-based replication to replicate to a table having at least one extra **BIT** column with a default value on the slave as compared to the master could cause the slave to fail. ([Bug#24490](#))
- Optimizations that are legal only for subqueries without tables and **WHERE** conditions were applied for any subquery without tables. ([Bug#24670](#))
- A query using **WHERE unsigned_column NOT IN ('negative_value')** could cause the server to crash. ([Bug#24261](#))
- A **FETCH** statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. ([Bug#24117](#))
- **CREATE TABLE ... SELECT** statements were not rolled back correctly. As part of the fix, such a statement now causes an implicit commit before and after it is executed. However, it does not cause a commit when used to create a temporary table. ([Bug#22864](#))
- SSL connections could hang at connection shutdown. ([Bug#24148](#), [Bug#21781](#))
- The **STDDEV()** function returned a positive value for data sets consisting of a single value. ([Bug#22555](#))
- **mysqltest** incorrectly tried to retrieve result sets for some queries where no result set was available. ([Bug#19410](#))
- **mysqltest** crashed with a stack overflow. ([Bug#24498](#))
- The server was built even when **configure** was run with the **--without-server** option. ([Bug#23973](#))
- **mysqld_error.h** was not installed when only the client libraries were built. ([Bug#21265](#))
- **mysql_install_db** did not create the **mysql.plugin** table if strict SQL mode was enabled. ([Bug#24270](#))

- The row count for **MyISAM** tables was not updated properly, causing **SHOW TABLE STATUS** to report incorrect values. ([Bug#23526](#))
- Using a view in combination with a **USING** clause caused column aliases to be ignored. ([Bug#25106](#))
- Using **ALTER TABLE** to convert a **CSV** table containing **NULL** values to **MyISAM** resulted in warnings. ([Bug#21328](#))
- A view was not handled correctly if the **SELECT** part contained `'\Z'`. ([Bug#24293](#))
- Inserting a row into a table without specifying a value for a **BINARY(N) NOT NULL** column caused the column to be set to spaces, not zeroes. ([Bug#14171](#))
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the **IS NULL** predicate. ([Bug#25027](#))
- A table created with the **ROW_FORMAT = FIXED** table option loses the option if an index is added or dropped with **CREATE INDEX** or **DROP INDEX**. ([Bug#23404](#))
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. ([Bug#15439](#))
- The **BUILD/check-cpu** script did not recognize Celeron processors. ([Bug#20061](#))
- Some problems uncovered by Valgrind were fixed. ([Bug#25396](#))
- `mysql_fix_privilege_tables` did not handle a password containing embedded space or apostrophe characters. ([Bug#17700](#))
- On Windows, the **SLEEP()** function could sleep too long, especially after a change to the system clock. ([Bug#14094](#), [Bug#17635](#), [Bug#24686](#))
- In the **INFORMATION_SCHEMA.KEY_COLUMN_USAGE** table, the value displayed for the **REFERENCED_TABLE_NAME** column was the table name as encoded for disk storage, not the actual table name. ([Bug#25026](#))
- Changing the value of **MI_KEY_BLOCK_LENGTH** in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing **MyISAM** tables as corrupt. ([Bug#22119](#))
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. ([Bug#20396](#))
- For **SET**, **SELECT**, and **DO** statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. ([Bug#19725](#))
- **SET lc_time_names = value** allowed only exact literal values, not expression values. ([Bug#22647](#))
- Changes to the `lc_time_names` system variable were not replicated. ([Bug#22645](#))
- **SELECT ... FOR UPDATE**, **SELECT ... LOCK IN SHARE MODE**, **DELETE**, and **UPDATE** statements executed using a full table scan were not releasing locks on rows that did not satisfy the **WHERE** condition. ([Bug#20390](#))
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. ([Bug#23619](#), [Bug#24492](#))
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. ([Bug#13926](#))
- Re-execution of **CREATE DATABASE**, **CREATE TABLE**, and **ALTER TABLE** statements in stored routines or as prepared statements caused incorrect results. ([Bug#22060](#))
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. ([Bug#24507](#))
- The Instance Manager **DROP INSTANCE** command did not work. ([Bug#23476](#))
- The Instance Manager **STOP INSTANCE** command took too much time and caused Instance Manager to be unresponsive. ([Bug#23215](#))
- The Instance Manager **STOP INSTANCE** command could not be applied to instances in the **Crashed**, **Failed**, or **Abandoned** state. ([Bug#22306](#))

- Instance Manager could crash during shutdown. ([Bug#19044](#))
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. ([Bug#23312](#))
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. ([Bug#16861](#))
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. ([Bug#15881](#))
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. ([Bug#25427](#))
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. ([Bug#24854](#), [Bug#19194](#))
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. ([Bug#24345](#))
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see [Section 12.5.2.5, “OPTIMIZE TABLE Syntax”](#)). ([Bug#23578](#))
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET`, rather than `OUT OF MEMORY (NEEDED NNNNNN BYTES)`. ([Bug#23443](#))
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. ([Bug#20867](#))
- Under some circumstances, a `REORGANIZE PARTITION` statement could crash `mysqld`. ([Bug#24502](#))
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. ([Bug#25048](#))
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. ([Bug#23139](#))
- Using `INSTALL PLUGIN` followed by a restart of the server caused an error due to memory not being properly initialized. ([Bug#22694](#))
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted `MyISAM` table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. ([Bug#22053](#))
- The `FEDERATED` storage engine did not support the `euckr` character set. ([Bug#21556](#))
- The `FEDERATED` storage engine did not support the `utf8` character set. ([Bug#17044](#))
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. ([Bug#24896](#))
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. ([Bug#22077](#))
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. ([Bug#22043](#))
- The `REPEAT ( )` function could return `NULL` when passed a column for the count argument. ([Bug#24947](#))
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. ([Bug#23260](#))
- `InnoDB` crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- `ROW_COUNT ( )` did not work properly as an argument to a stored procedure. ([Bug#23760](#))

- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`. (Bug#21789)

This patch was reverted in MySQL 5.1.18.

- It was possible to set the backslash character (`" \ "`) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. (Bug#21412)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- An `ALTER TABLE` statement that used a `RENAME` clause in combination with a `MODIFY` or `CHANGE` that did not actually change the table (for example, when it changed a column's type from `INT` to `INT`). The behavior caused by this bug differed according to whether or not the storage engine used by the table was transactional or non-transactional. For transactional tables (such as those using the `InnoDB` storage engine), the statement simply failed; for non-transactional tables (such as those using the `MyISAM` storage engine), the `ALTER TABLE` statement succeeding renaming the table, but subsequent `SELECT` statements against the renamed table would fail. (Bug#22369)
- Queries of the form `SELECT ... WHERE string = ANY(...)` failed when the server used a single-byte character set and the client used a multi-byte character set. (Bug#20835)
- A partitioned table that used the `DATA DIRECTORY` option, where the data directory was the same as the directory in which the table definition file resided, became corrupted following `ALTER TABLE ENGINE=ARCHIVE`. This was actually due to an issue with the `ARCHIVE` storage engine, and not with partitioned tables in general. (Bug#22634)
- `NDB Cluster` (Cluster APIs): Deletion of an `Ndb_cluster_connection` object took a very long time. (Bug#25487)
- `NDB Cluster` (Replication): Certain errors in replication setups could lead to subsequent node failures. (Bug#25755)
- `NDB Cluster` (Replication): Connecting a `mysqld` to a cluster where not all nodes were running, starting the remaining cluster nodes, and then disconnecting from the cluster caused the `mysqld` process to crash. (Bug#25387)
- `NDB Cluster` (Replication): Connecting an API node to the cluster during a node restart while performing database operations could cause the restarting node to fail. (Bug#25329)
- `NDB Cluster` (Disk Data): Following 3 or more missed local checkpoints by a cluster node, a restart of the node caused incorrect undo information to be used for Disk Data tables. (Bug#25636)
- `NDB Cluster`: It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. (Bug#25746)
- `NDB Cluster`: Hosts in clusters with a large number of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- `NDB Cluster`: In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug#25668)
- `NDB Cluster`: Non-32-bit, non-aligned columns were not handled correctly in explicitly partitioned `NDB` tables. (Bug#25587)
- `NDB Cluster`: Some aggregate queries such as `SELECT COUNT(*)` performed a table scan on `NDB` tables rather than checking table statistics, causing such queries to perform much more slowly in MySQL Cluster 5.1 than in 5.0. (Bug#25567)
- `NDB Cluster`: Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. (Bug#25562)
- `NDB Cluster`: The failure of a master node during a node restart could lead to a resource leak, causing later node failures. (Bug#25554)
- `NDB Cluster`: The failure of a node during a local checkpoint could lead to other node failures. (Bug#25468)
- `NDB Cluster`: A node shutdown occurred if the master failed during a commit. (Bug#25364)
- `NDB Cluster`: Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. (Bug#24820)

- **NDB Cluster**: The management server did not handle logging of node shutdown events correctly in certain cases. ([Bug#22013](#))
- **NDB Cluster**: A potential memory leak in the **NDB** storage engine's handling of file operations was uncovered. ([Bug#21858](#))
- **NDB Cluster**: When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. ([Bug#19645](#))
- **NDB Cluster** (NDB API): Invoking the `NdbTransaction::execute()` method using execution type **Commit** and abort option **AO_IgnoreError** could lead to a crash of the transaction coordinator (DBTC). ([Bug#25090](#))
- **NDB Cluster** (NDB API): A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). ([Bug#25059](#))
- **NDB Cluster** (NDB API): Due to an error in the computation of table fragment arrays, some transactions might not be executed from the correct starting point. ([Bug#24914](#))
- **NDB Cluster** (Replication): Following a restart of the master cluster, the latest GCI was set to 0 upon reconnection to the slave. ([Bug#21806](#))
- **NDB Cluster** (Disk Data): A **MEDIUMTEXT** column of a Disk Data table was stored in memory rather than on disk, even if the column was not indexed. ([Bug#25001](#))
- **NDB Cluster** (Disk Data): Performing a node restart with a newly dropped Disk Data table could lead to failure of the node during the restart. ([Bug#24917](#))
- **NDB Cluster** (Disk Data): When restoring from backup a cluster containing any Disk Data tables with hidden primary keys, a node failure resulted which could lead to a crash of the cluster. ([Bug#24166](#))
- **NDB Cluster** (Disk Data): Repeated **CREATE**, **DROP**, or **TRUNCATE** in various combinations with system restarts between these operations could lead to the eventual failure of a system restart. ([Bug#21948](#))
- **NDB Cluster** (Disk Data): Extents that should have been available for re-use following a **DROP TABLE** operation were not actually made available again until after the cluster performed a local checkpoint. ([Bug#17605](#))
- **NDB Cluster**: Under certain rare circumstances, local checkpoints were not performed properly, leading to an inability to restart one or more data nodes. ([Bug#24664](#))
- **NDB Cluster** (NDB API): When using the `NdbTransaction::execute()` method, a very long timeout (greater than 5 minutes) could result if the last data node being polled was disconnected from the cluster. ([Bug#24949](#))
- **NDB Cluster**: When a data node was shut down using the management client **STOP** command, a connection event (**NDB_LE_Connected**) was logged instead of a disconnection event (**NDB_LE_Disconnected**). ([Bug#22773](#))
- **NDB Cluster**: **SELECT** statements with a **BLOB** or **TEXT** column in the selected column list and a **WHERE** condition including a primary key lookup on a **VARCHAR** primary key produced empty result sets. ([Bug#19956](#))
- **NDB Cluster**: `ndb_config` failed when trying to use 2 management servers and node IDs. ([Bug#23887](#))
- **STR_TO_DATE()** returned **NULL** if the format string contained a space following a non-format character. ([Bug#22029](#))
- **yaSSL** crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Selecting into variables sometimes returned incorrect wrong results. ([Bug#20836](#))
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the **CREATE VIEW** and **SHOW VIEW** privileges. ([Bug#20589](#))
- A server crash occurred when using **LOAD DATA** to load a table containing a **NOT NULL** spatial column, when the statement did not load the spatial column. Now a **NULL supplied to NOT NULL column** error occurs. ([Bug#22372](#))
- Unsigned **BIGINT** values treated as signed values by the **MOD()** function. ([Bug#19955](#))
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. ([Bug#19817](#))
- The **DELIMITER** statement did not work correctly when used in an SQL file run using the **SOURCE** statement. ([Bug#19799](#))

- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. (Bug#19371)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug#8804, Bug#23485)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24089)
- The MySQL 5.1.12 binaries for Windows were missing the `FEDERATED`, `EXAMPLE`, and `BLACKHOLE` storage engines. (Bug#23900)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug#22129)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. (Bug#22229)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- On HP-UX, `mysqltest` (non-thread-safe) crashed due to being linked against a thread-safe `libmysys` library. (Bug#23984)

C.1.14. Changes in MySQL 5.1.15 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.15.

C.1.14.1. Changes in release MySQL 5.1.15-ndb-6.1.19-beta (01 August 2007)

This is a new Beta development release, incorporating recent feature enhancements since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.19/. The file `mysqlcom-5.1.15-ndb-6.1.19-telco.tar.gz` in this directory contains the complete source archive.

Note

Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL 5.1.15-ndb-6.1.12, MySQL 5.1.15-ndb-6.1.13, MySQL 5.1.15-ndb-6.1.14, MySQL 5.1.15-ndb-6.1.15, MySQL 5.1.15-ndb-6.1.16, MySQL 5.1.15-ndb-6.1.17, and MySQL 5.1.15-ndb-6.1.18. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- An **INFO** event is now sent if the time between global checkpoints is excessive, or if **DUMP 7901** is issued in the management client.
- Whenever a TCP send buffer is over 80% full, temporary error 1218 (**SEND BUFFERS OVERLOADED IN NDB KERNEL**) is now re-

turned. See [SendBufferMemory](#) for more information.

C.1.14.2. Changes in release MySQL 5.1.15-ndb-6.1.18-beta (Not released)

This is a new Beta development release, fixing recently discovered bugs in the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Note

Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL 5.1.15-ndb-6.1.12, MySQL 5.1.15-ndb-6.1.13, MySQL 5.1.15-ndb-6.1.14, MySQL 5.1.15-ndb-6.1.15, MySQL 5.1.15-ndb-6.1.16, and MySQL 5.1.15-ndb-6.1.17. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bugs:

- **Replication:** Storage engine error conditions in row-based replication were not correctly reported to the user. ([Bug#29570](#))
- A problem with the fix for [Bug#29354](#) caused an assertion when two local checkpoints were run during node recovery.
- **Disk Data:** Disk data meta-information that existed in `ndbnd` might not be visible to `mysqld`. ([Bug#28720](#))
- **Disk Data:** The number of free extents was incorrectly reported for some tablespaces. ([Bug#28642](#))
- When restarting a data node, queries could hang during that node's start phase 5, and only continue once the node entered phase 6. ([Bug#29364](#))

C.1.14.3. Changes in release MySQL 5.1.15-ndb-6.1.17-beta (Released 03 July 2007)

This is a new Beta development release, fixing recently discovered bugs in the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.17/. The file `mysqlcom-5.1.15-ndb-6.1.17-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL 5.1.15-ndb-6.1.12, MySQL 5.1.15-ndb-6.1.13, MySQL 5.1.15-ndb-6.1.14, MySQL 5.1.15-ndb-6.1.15, and MySQL 5.1.15-ndb-6.1.16. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- Batching of updates on cluster replication slaves, enabled using the `--slave-allow-batching` option for `mysqld`.

This release fixes the following bug:

- Replica redo logs were inconsistently handled during a system restart. ([Bug#29354](#))

C.1.14.4. Changes in release MySQL 5.1.15-ndb-6.1.16-beta (Released 29 June 2007)

This is a new Beta development release, fixing recently discovered bugs in the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.16/. The file `mysqlcom-5.1.15-ndb-6.1.16-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL 5.1.15-ndb-6.1.12, MySQL 5.1.15-ndb-6.1.13, MySQL 5.1.15-ndb-6.1.14, and MySQL 5.1.15-ndb-6.1.15. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bugs:

- If at least 2 files were involved in REDO invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. ([Bug#29057](#))
- The wrong data pages were sometimes invalidated following a global checkpoint. ([Bug#29067](#))
- An invalid comparison made during REDO validation that could lead to an `ERROR WHILE READING REDO LOG` condition. ([Bug#29118](#))
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. ([Bug#29176](#))

Note

This supersedes an earlier fix for this bug that was made in MySQL 5.1.15-ndb-6.1.14.

- When a node failed to respond to a `COPY_GCI` signal as part of a global checkpoint, the master node was killed instead instead of the node that actually failed. ([Bug#29331](#))

C.1.14.5. Changes in release MySQL 5.1.15-ndb-6.1.15-beta (Released 20 June 2007)

This is a new Beta development release, fixing a recently discovered bug in the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.15/. The file `mysqlcom-5.1.15-ndb-6.1.15-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL

5.1.15-ndb-6.1.12, MySQL 5.1.15-ndb-6.1.13, and MySQL 5.1.15-ndb-6.1.14. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bug:

- Memory corruption could occur due to a problem in the [DBTUP](#) kernel block. ([Bug#29229](#))

C.1.14.6. Changes in release MySQL 5.1.15-ndb-6.1.14-beta (Released 19 June 2007)

This is a new Beta development release, incorporating bugfixes made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.14/. The file `mysqlcom-5.1.15-ndb-6.1.14-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, MySQL 5.1.15-ndb-6.1.12, and MySQL 5.1.15-ndb-6.1.13. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bugs:

- In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `P0.sysfile` files, `QMGR` could refuse to start, issuing an invalid `INSUFFICIENT NODES FOR RESTART` error instead. ([Bug#29167](#))
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. ([Bug#29176](#))

C.1.14.7. Changes in release MySQL 5.1.15-ndb-6.1.13-beta (Released 15 June 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.13/. The file `mysqlcom-5.1.15-ndb-6.1.13-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, MySQL 5.1.15-ndb-6.1.11, and MySQL 5.1.15-ndb-6.1.12. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- Read ahead was implemented for backups of Disk Data tables, resulting in a 10 to 15% increase in backup speed of Disk Data tables. ([Bug#29099](#))

C.1.14.8. Changes in release MySQL 5.1.15-ndb-6.1.12-beta (Released 13 June 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.12/. The file `mysqlcom-5.1.15-ndb-6.1.12-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, MySQL 5.1.15-ndb-6.1.10, and MySQL 5.1.15-ndb-6.1.11. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- It is now possible to set the maximum size of the allocation unit for table memory using the `MaxAllocate` configuration parameter. ([Bug#29044](#))
- Backup dump output was extended to provide more information.
- New cluster management client `DUMP` commands were added to aid in tracking transactions, scan operations, and locks. See `DUMP 2350` and `DUMP 2550`.

C.1.14.9. Changes in release MySQL 5.1.15-ndb-6.1.11-beta (Released 06 June 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.11/. The file `mysqlcom-5.1.15-ndb-6.1.11-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, MySQL 5.1.15-ndb-6.1.9, and MySQL 5.1.15-ndb-6.1.10. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- It is now possible to set the size of redo log files (fragment log files) using the `FragmentLogFileSize` configuration parameter.
- A new configuration parameter `ODirect` causes `NDB` to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.

This release fixes the following bugs:

- Having large amounts of memory locked caused swapping to disk. ([Bug#28751](#))
- It was not possible to set a separate watchdog timeout at startup. ([Bug#28899](#))
- LCP files were not removed following an initial system restart. ([Bug#28726](#))
- **Disk Data:** Repeated **INSERT** and **DELETE** operations on a Disk Data table having one or more large **VARCHAR** columns could cause data nodes to fail. ([Bug#20612](#))

C.1.14.10. Changes in release MySQL 5.1.15-ndb-6.1.10-beta (Released 30 May 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.10/. The file `mysqlcom-5.1.15-ndb-6.1.10-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, MySQL 5.1.15-ndb-6.1.8, and MySQL 5.1.15-ndb-6.1.9. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Functionality added or changed:

- A new `times` printout was added in the `ndbd` watchdog thread.
- The names of some log and other files were changed to avoid issues with the `tar` command's 99-character filename limit.
- Some unneeded printouts in the `ndbd` out file were removed.

This release fixes the following bugs:

- Heartbeat failures could occur under high load. ([Bug#28783](#))
- A corrupt schema file could cause a `FILE ALREADY OPEN` error. ([Bug#28770](#))
- A race condition could occur between `NODE_FAILREP` and `COPY_GCIREQ` events. ([Bug#28717](#))
- While loading data to the cluster after a version upgrade, the data nodes failed due to `ndbrequire` failures in `PGMAN`. ([Bug#28525](#))
- A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. ([Bug#28653](#))
- The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. ([Bug#28749](#))

C.1.14.11. Changes in release MySQL 5.1.15-ndb-6.1.9-beta (Released 24 May 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.9/. The file `mysqlcom-5.1.15-ndb-6.1.9-telco.tar.gz` in this directory contains the complete source archive.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, MySQL 5.1.15-ndb-6.1.7, and MySQL 5.1.15-ndb-6.1.8. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bugs:

- The cluster backup process scanned in [ACC](#) index order, which had bad effects for disk data. ([Bug#28593](#))
- The [NDB](#) transporter would hang when more than 1024 signals were received at one time. ([Bug#28443](#))

C.1.14.12. Changes in release MySQL 5.1.15-ndb-6.1.8-beta (Released 05 May 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.8/. The file `mysqlcom-5.1.15-ndb-6.1.8-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, MySQL 5.1.15-ndb-6.1.6, and MySQL 5.1.15-ndb-6.1.7. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

This release fixes the following bugs:

- Setting [MaxNoOfTables](#) very low and relative to [DataMemory](#) caused `OUT OF MEMORY IN NDB KERNEL` errors when inserting relatively small amounts of data into NDB tables. ([Bug#24173](#))
- Local checkpoint files related to dropped [NDB](#) tables were not removed. ([Bug#28348](#))
- **Disk Data:** Extremely large inserts into Disk Data tables could lead to data node failure in some circumstances. ([Bug#27942](#))
- Repeated insertion of data generated by `mysqldump` into [NDB](#) tables could eventually lead to failure of the cluster. ([Bug#27437](#))
- **Cluster APIs:** In a multi-operation transaction, a delete operation followed by the insertion of an implicit [NULL](#) failed to overwrite an existing value. ([Bug#20535](#))

C.1.14.13. Changes in release MySQL 5.1.15-ndb-6.1.7-beta (Released 05 May 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL

5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, MySQL 5.1.15-ndb-6.1.5, and MySQL 5.1.15-ndb-6.1.6. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13](#), “Changes in release 5.1.15 (25 January 2007)”).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.7 from a previous release. The internal specifications for columns in **NDB** tables has changed to allow compatibility with future MySQL Cluster and MySQL Cluster 5.1 Carrier Grade Edition releases that are expected to implement online adding and dropping of columns. This change is not backwards compatible with MySQL 5.1.16-ndb-6.2.0, ndb-6.1.x versions prior to MySQL 5.1.15-ndb-6.1.7, or MySQL Cluster mainline releases prior to 5.1.18.

See [the related note](#) in [Section 16.5.2](#), “Cluster Upgrade and Downgrade Compatibility”, for important information prior to upgrading a MySQL Cluster to MySQL 5.1.15-ndb-6.1.7 or later from MySQL 5.1.15-ndb-6.1.6 or an earlier ndb-6.1.x release.

See also [Bug#28205](#).

Functionality added or changed:

- **Incompatible change:** The schema for the `ndb_apply_status` table in the `mysql` system database has changed. When upgrading to this release from a previous MySQL Cluster 5.1 Carrier Grade Edition or mainline MySQL 5.1 release, you must drop the `mysql.ndb_apply_status` table, then restart the server in order for the table to be re-created with the new schema.

See [Section 16.10.4](#), “Cluster Replication Schema and Tables”, for additional information.

This release fixes the following bugs:

- Under certain rare circumstances, `DROP TABLE` or `TRUNCATE` of an **NDB** table could cause a node failure or forced cluster shutdown. ([Bug#27581](#))
- Memory usage of a `mysqld` process grew even while idle. ([Bug#27560](#))
- **Cluster APIs:** An issue with the way in which the `NdbDictionary::Dictionary::listEvents()` method freed resources could sometimes lead to memory corruption. ([Bug#27663](#))
- **Cluster Replication:** Under very high loads, checkpoints could be read or written with checkpoint indexes out of order. ([Bug#27651](#))
- **Cluster Replication:** It was possible for API nodes to begin interacting with the cluster subscription manager before they were fully connected to the cluster. ([Bug#27728](#))
- Some queries that updated multiple tables were not backed up or replicated correctly. ([Bug#27748](#))
- **Disk Data:** Changes to a Disk Data table made as part of a transaction could not be seen by the client performing the changes until the transaction had been committed. ([Bug#27757](#))
- An `INSERT` followed a delete `DELETE` on the same **NDB** table caused a memory leak. ([Bug#27756](#))
(This bug was introduced by the fix for [Bug#20612](#).)
- Under some circumstances, a node restart could fail to update the Global Checkpoint Index (GCI). ([Bug#28023](#))
- Under certain rare circumstances, `ndbd` could get caught in an infinite loop when one transaction took a read lock and then a second transaction attempted to obtain a write lock on the same tuple in the lock queue. ([Bug#28073](#))
- The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. ([Bug#28093](#))
- **Disk Data:** Changing a column specification or issuing a `TRUNCATE` statement on a Disk Data table caused the table to become an in-memory table. ([Bug#24667](#))
- Performing a delete followed by an insert during a local checkpoint could cause a `ROWID ALREADY ALLOCATED` error. ([Bug#27205](#))

- **Disk Data:** When restarting a data node following the creation of a large number (~200) of Disk Data objects, the cluster could not assign a node ID to the restarting node. ([Bug#25741](#))
- **Cluster Replication / Disk Data:** An issue with replication of Disk Data tables could in some cases lead to node failure. ([Bug#28161](#))
- `mysqldump` could not dump log tables. ([Bug#26121](#))
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. ([Bug#25530](#))

C.1.14.14. Changes in release MySQL 5.1.15-ndb-6.1.6-beta (Not released)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, MySQL 5.1.15-ndb-6.1.4, and MySQL 5.1.15-ndb-6.1.5. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13](#), “Changes in release 5.1.15 (25 January 2007)”).

Functionality added or changed:

- **Incompatible change:** The schema for the `ndb_apply_status` table in the `mysql` system database has changed. When upgrading to this release from a previous MySQL Cluster 5.1 Carrier Grade Edition or mainline MySQL 5.1 release, you must drop the `mysql.ndb_apply_status` table, then restart the server in order for the table to be re-created with the new schema.

See [Section 16.10.4, “Cluster Replication Schema and Tables”](#), for additional information.

This release fixes the following bugs:

- **Cluster APIs:** An issue with the way in which the `NdbDictionary::Dictionary::listEvents()` method freed resources could sometimes lead to memory corruption. ([Bug#27663](#))
- **Cluster Replication:** Trying to replicate a large number of frequent updates with a relatively small relay log (`max-re-lay-log-size` set to 1M or less) could cause the slave to crash. ([Bug#27529](#))
- A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. ([Bug#27466](#))
- A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. ([Bug#27466](#))
- `mysqld` could crash shortly after a data node failure following certain DML operations. ([Bug#27169](#))
- **Disk Data:** `DROP INDEX` on a Disk Data table did not always move data from memory into the tablespace. ([Bug#25877](#))
- It was not possible to set `LockPagesInMainMemory` equal to 0. ([Bug#27291](#))
- A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. ([Bug#27286](#))
- When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. ([Bug#27283](#))
- A delete operation using a scan following by an insert using a scan could cause a data node to fail. ([Bug#27203](#))
- The same failed request from an API node could be handled by the cluster multiple times, resulting in reduced performance.

[Bug#27087](#))

- `mysqld` processes would sometimes crash under high load. ([Bug#26825](#))

This improves on and replaces the fix for this bug that was made in MySQL 5.1.15-ndb-6.1.5.

- The failure of a data node while restarting could cause other data nodes to hang or crash. ([Bug#27003](#))

C.1.14.15. Changes in release MySQL 5.1.15-ndb-6.1.5-beta (15 March 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.5/. The file `mysqlcom-5.1.15-ndb-6.1.5-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, MySQL 5.1.15-ndb-6.1.3, and MySQL 5.1.15-ndb-6.1.4. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#)).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.5 from a previous release. This release is not binary compatible with releases previous to MySQL 5.1.15-ndb-6.1.3. This means that:

- You cannot perform an online upgrade to this release from MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, or any of the mainline MySQL 5.1 releases. When upgrading from one of these versions, you must shut down the cluster, replace all binaries, then restart the cluster.
- You must recompile all NDB API and MGM API applications used with a previous version of MySQL Cluster, including those compiled against MySQL 5.1.15-ndb-6.1.3.

This release is also not backwards compatible with MySQL 5.1.15-ndb-6.1.14 or any release previous to MySQL 5.1.15-ndb-6.1.14 due to changes in the `mysql` system database. See *Functionality added or changed* for more information.

Functionality added or changed:

- **Incompatible change:** The schema for the `ndb_apply_status` table in the `mysql` system database has changed. When upgrading to this release from a previous MySQL Cluster 5.1 Carrier Grade Edition or mainline MySQL 5.1 release, you must drop the `mysql.ndb_apply_status` table, then restart the server in order for the table to be re-created with the new schema.

See [Section 16.10.4, “Cluster Replication Schema and Tables”](#), for additional information.

This release fixes the following bugs:

- An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. ([Bug#26720](#))
- Creating a table on one SQL node while in single user mode caused other SQL nodes to crash. ([Bug#26997](#))
- `mysqld` processes would sometimes crash under high load. ([Bug#26825](#))

- **Disk Data:** When creating a log file group, setting `INITIAL_SIZE` to less than `UNDO_BUFFER_SIZE` caused data nodes to crash. (Bug#25743)

C.1.14.16. Changes in release MySQL 5.1.15-ndb-6.1.4-beta (09 March 2007 - testing only)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

This was a testing release only, and not intended for wide distribution.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, and MySQL 5.1.15-ndb-6.1.3. This version also incorporates all bugfixes and feature changes which were added in the mainline MySQL 5.1 releases up to and including 5.1.15 (see [Section C.1.13](#), “Changes in release 5.1.15 (25 January 2007)”).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.4 from a previous release. This release is not binary compatible with previous releases. This means that:

- You cannot perform an online upgrade to this release from MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, MySQL 5.1.15-ndb-6.1.2, or any of the mainline MySQL 5.1 releases. When upgrading from one of these versions, you must shut down the cluster, replace all binaries, then restart the cluster.
- You must recompile all NDB API and MGM API applications used with a previous version of MySQL Cluster, including those compiled against MySQL 5.1.15-ndb-6.1.3.

Functionality added or changed:

- **NDB API:** It is now possible to specify the transaction coordinator when starting a transaction. See `Ndb::startTransaction()`, for more information.
- **NDB API:** It is now possible to iterate over all existing `Ndb` objects using three new methods of the `Ndb_cluster_connection` class: `lock_ndb_objects()`, `get_next_ndb_object()`, and `unlock_ndb_objects()`. For more information about these methods and their use, see `ndb_cluster_connection::get_next_ndb_object()`, in the MySQL Cluster API Guide.
- A new option `--ndb-wait-connected` has been added for `mysqld`. It causes `mysqld` wait a specified amount of time to be connected to the cluster before starting to accept client connections. See [here](#), for more information.
- Data node memory allocation has been improved. On 32-bit platforms, it should now be possible to use close to 3GB RAM for `In-dexMemory` and `DataMemory` combined.

This release fixes the following bugs:

- Using only the `--print_data` option (and no other options) with `ndb_restore` caused `ndb_restore` to fail. (Bug#26741)
This bug was introduced by the fix for Bug#14612.
- An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- Assigning a node ID greater than 63 to an SQL node caused an out of bounds error in `mysqld`. It should now be possible to assign to SQL nodes node IDs up to 255. (Bug#26663)

C.1.14.17. Changes in release MySQL 5.1.15-ndb-6.1.3-beta (25 February 2007)

This is a new Beta development release, fixing recently discovered bugs and incorporating improvements made since the previous MySQL Cluster 5.1 Carrier Grade Edition release.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.3. The file `mysqlcom-5.1.15-ndb-6.1.3-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, and MySQL 5.1.15-ndb-6.1.2. This version also incorporates all bugfixes and feature changes which were added in the mainline 5.1.15 release; information about these can be found in [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.3 from a previous release. This release is not binary compatible with releases previous to MySQL 5.1.15-ndb-6.1.2. This means that:

- You cannot perform an online upgrade to this release from MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, or any of the mainline MySQL 5.1 releases. When upgrading from one of these versions, you must shut down the cluster, replace all binaries, then restart the cluster.

However, you *can* perform an online upgrade of a Cluster running MySQL 5.1.15-ndb-6.1.2 to MySQL 5.1.15-ndb-6.1.3, using the rolling upgrade procedure described in [Section 16.5.1, “Performing a Rolling Restart of the Cluster”](#). You should replace all binaries for all data nodes, management nodes, and SQL nodes as part of this process. When upgrading the data nodes, you will need to restart each data with the `--initial` option.

- You must recompile all NDB API and MGM API applications used with a previous version of MySQL Cluster, including those compiled against MySQL 5.1.15-ndb-6.1.2.

Functionality added or changed:

- The `ndb_show_tables` utility now displays information about table events. (See [Section 16.9.14, “ndb_show_tables — Display List of NDB Tables”](#).)
- The `ndbd_redo_log_reader` utility is now part of the default build. For more information, see [Section 16.9.11, “ndbd_redo_log_reader — Check and Print Content of Cluster Redo Log”](#).
- It is now possible to disable arbitration by setting `ArbitrationRank=0` on all management and SQL nodes.
- **NDB API:** A new `listEvents()` method has been added to the `Dictionary` class. See [Dictionary Class Methods](#), for more information.

This release fixes the following bugs:

- **NDB Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. ([Bug#26515](#))
- No appropriate error message was provided when there was insufficient REDO log file space for the cluster to start. ([Bug#25801](#))
- **Disk Data:** Use of a tablespace whose `INITIAL_SIZE` was greater than 1 GB could cause the cluster to crash. ([Bug#26487](#))
- A memory allocation failure in the cluster Subscription Manager could cause the cluster to crash. ([Bug#25239](#))
- The `InvalidUndoBufferSize` error used the same error code (763) as the `IncompatibleVersions` error. `InvalidUndoBufferSize` now uses its own error code (779). ([Bug#26490](#))

- **Disk Data:** A memory overflow could occur with tables having a large amount of data stored on disk, or with queries using a very high degree of parallelism on Disk Data tables. ([Bug#26514](#))
- The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. ([Bug#26481](#))
- Takeover for local checkpointing due to multiple failures of master nodes was sometimes handled incorrectly. ([Bug#26457](#))
- The `LockPagesInMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was `1`, this could sometimes result in data node failure due to missed heartbeats. ([Bug#26454](#))
- Under some circumstances, following the restart of a management node, all cluster data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. ([Bug#26293](#))
- An error was produced when `SHOW TABLE STATUS` was used on an NDB table that had no `AUTO_INCREMENT` column. ([Bug#21033](#))

Note

This improves on and supersedes an earlier fix that was made for this issue in MySQL 5.1.12.

C.1.14.18. Changes in release MySQL 5.1.15-ndb-6.1.2-beta (07 February 2007)

This is a new Beta development release, fixing a recently discovered bug.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.2. The file `mysqlcom-5.1.15-ndb-6.1.2-telco.tar.gz` in this directory contains the complete source archive.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.2. The file `mysqlcom-5.1.15-ndb-6.1.2-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This Beta release is a hotfix release, made to resolve a single critical issue which occurred in MySQL 5.1.15-ndb-6.1.1-beta. It incorporates all bugfixes and feature changes made in MySQL 5.1.14-ndb-6.1.0 and MySQL 5.1.15-ndb-6.1.1. This version also incorporates all bugfixes and feature changes which were added in the mainline 5.1.15 release; information about these can be found in [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.2 from a previous release. This release is not binary compatible with any previous releases. This means that:

- You cannot perform an online upgrade to this release from MySQL 5.1.14-ndb-6.1.0, MySQL 5.1.15-ndb-6.1.1, or any of the mainline MySQL 5.1 releases. You must shut down the cluster, replace all binaries, then restart the cluster.
- You must recompile any MySQL Cluster API applications used with a previous version of MySQL Cluster. This includes all NDB API and MGM API applications.

This release fixes a single critical bug:

- Using node IDs greater than 48 could sometimes lead to incorrect memory access and a subsequent forced shutdown of the cluster. ([Bug#26267](#))

C.1.14.19. Changes in release MySQL 5.1.15-ndb-6.1.1-beta (01 February 2007)

This is a new Beta development release, fixing recently discovered bugs.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.15-ndb-6.1.1. The file `mysqlcom-5.1.15-ndb-6.1.1-telco.tar.gz` in this directory contains the complete source archive.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied in this Beta release since the release of MySQL Cluster 5.1.14-ndb-6.1.0. This version also incorporates all bugfixes and feature changes which were added in the mainline 5.1.15 release; information about these can be found in [Section C.1.13, “Changes in release 5.1.15 \(25 January 2007\)”](#).

Important

Upgrading to MySQL 5.1.15-ndb-6.1.1 from a previous release. This release is not binary compatible with any previous releases. This means that:

- You cannot perform an online upgrade to this release from either MySQL 5.1.14-ndb-6.1.0 or from any of the mainline MySQL 5.1 releases. You must shut down the cluster, replace all binaries, then restart the cluster.
- You must recompile any MySQL Cluster API applications used with a previous version of MySQL Cluster. This includes all NDB API and MGM API applications.

Functionality added or changed:

- A single cluster can now support up to 255 API nodes, including MySQL servers acting as SQL nodes. See [Issues exclusive to MySQL Cluster](#) for more information.
- The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see [LockPagesInMainMemory](#). (Bug#25686)

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release described in the section cited above.

Bugs fixed:

- A memory leak could cause problems during a node or cluster shutdown or failure. (Bug#25997)
- **Cluster Replication:** Certain errors in replication setups could lead to subsequent node failures. (Bug#25755)
- Hosts in clusters with a large number of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. (Bug#19645)
- **Cluster APIs / Disk Data:** A delete and a read performed in the same operation could cause one or more of the cluster's data nodes to crash. This could occur when the operation affected more than 5 columns concurrently, or when one or more of the columns was of the VARCHAR type and was stored on disk. (Bug#25794)
- An element could sometimes be inserted twice into the hash table, causing a data node to crash. (Bug#25286)

C.1.15. Changes in release 5.1.14 (05 December 2006)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** Previously, you could create a user-defined function (UDF) or stored function with the same name as a built-in function, but could not invoke the UDF. Now an error occurs if you try to create such a UDF. The server also now generates a warning if you create a stored function with the same name as a built-in function. It is not considered an error to create a stored function with the same name as a built-in function because you can invoke the function using `db_name.func_name()` syntax. However, the server now generates a warning in this case. (Bug#22619, Bug#18239)

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

- **Incompatible change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **NDB Cluster:** Two major changes have taken place with regard to the MySQL Cluster system tables. These are:
 1. **Incompatible change:** The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.
 2. The `mysql.ndb_apply_status` and `mysql.ndb_schema` tables (formerly `cluster.apply_status` and `cluster.schema` are now created by `ndb_restore`, in the event that they do not already exist on the slave cluster. (Bug#14612)

Note

When upgrading from versions of MySQL previous to 5.1.14 to 5.1.14 or later, `mysql_fix_privilege_tables` merely creates a new `mysql.ndb_binlog_index` table, but does not remove the existing `cluster` database (or, if upgrading from MySQL 5.1.7 or earlier, the existing `cluster_replication` database), nor any of the tables in it.

For more information, see [Section 16.10.4, “Cluster Replication Schema and Tables”](#).

- **NDB Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`. *Note that this change applies only to tables using the NDB storage engine.*

Unique indexes on columns in NDB tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on NDB table columns; this can be used to search for NULL values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not allowed to be searched in some cases, the NDB storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

Note that a warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with NULL values if this can be avoided.

(Bug#21507)

- **NDB Cluster**: Backup messages are now printed to the Cluster log. (Bug#24544)
- **NDB Cluster**: The error message `MANAGEMENT SERVER CLOSED CONNECTION`, when recorded in the MySQL error log, now includes a timestamp indicating when the error took place. (Bug#21519)
- **NDB Cluster** (Disk Data): The output of `mysqldump` now includes by default all tablespace and logfile group definitions used by any tables or databases that are dumped. (Bug#20839)

Note

The working of the `--all-tablespaces` or `-Y` option for `mysqldump` remains unaffected by this change.

- Direct and indirect usage of stored routines, user-defined functions, and table references is now prohibited in `CREATE EVENT` and `ALTER EVENT` statements. (Bug#22830)

See [Section 21.2.2, “CREATE EVENT Syntax”](#), and [Section 21.2.1, “ALTER EVENT Syntax”](#), for more specific information.

- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug#23703)
- All standard XPath comparison operators are now supported for use with the `ExtractValue()` and `UpdateXML()` functions. (Bug#22823)
- For the `mysql` client, display of result set metadata now is enabled with the `--column-type-info` option rather than with `-debug-info/-T`.

Bugs fixed:

- **NDB Cluster**: If the value set for `MaxNoOfAttributes` is excessive, a suitable error message is now returned. (Bug#19352)
- **NDB Cluster**: Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **NDB Cluster**: Multiple occurrences of error conditions were logged with duplicated error messages rather than being reported with a single error message stating that the error was encountered *N* times. (Bug#22313)
- **NDB Cluster**: Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. (Bug#24447)
- **NDB Cluster**: Different error messages were returned for similar cases involving failure to allocate memory for Cluster operations. (Bug#19203)
- **NDB Cluster**: Some values of `MaxNoOfTriggers` could cause the server to become inaccessible following startup of the data nodes. (Bug#19454)
- **NDB Cluster** (Replication): If errors occurred during purging of the binary logs, extraneous rows could remain left in the `bin-log_index` table. (Bug#15021)
- **NDB Cluster** (Disk Data): `ndb_restore` could sometimes fail when attempting to restore Disk Data tables due to data node failure caused by accessing uninitialized memory. (Bug#24331)
- **NDB Cluster** (Disk Data): Excessive fragmentation of Disk Data files (including log files and data files) could occur during the course of normal use. (Bug#24143)
- **NDB Cluster** (Disk Data): It was possible to execute a statement for creating a Disk Data table that referred to a nonexistent tablespace, in which case the table was an in-memory **NDB** table. Such a statement instead now fails with an appropriate error message. (Bug#23576)
- **NDB Cluster** (Disk Data): Under some circumstances, a `DELETE` from a Disk Data table could cause `mysqld` to crash. (Bug#23542)
- **NDB Cluster** (Cluster APIs): Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused the cluster's data nodes to fail. (Bug#24503)
- **NDB Cluster**: A value equal to or greater than the allowed maximum for `LongMessageBuffer` caused all data nodes to crash. (Bug#22547)

- **NDB Cluster**: The failure of a data node failure during a schema operation could lead to additional node failures. (Bug#24752)
- **NDB Cluster**: A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug#24717)
- **NDB Cluster**: The simultaneous shutdown of `mysqld` and `ndbd` processes caused unnecessary locking. (Bug#24655)
- **NDB Cluster**: The failure of the master node in a node group during the allocation of node IDs could cause `ndb_mgmd` to hang. (Bug#24543)
- **NDB Cluster**: In certain rare cases, a data node could crash due to a typographical error in the MySQL Cluster source code. (Bug#24476)
- **NDB Cluster**: Creating a new tables containing a **BLOB** column when the server was short of memory could cause the server to crash. (Bug#24470)
- **NDB Cluster**: Any statement following the execution of `CREATE TABLE ... LIKE ndb_table` (where `ndb_table` was a table using the **NDB** storage engine), would cause the `mysql` client to hang. (Bug#24301)
- **NDB Cluster**: When the management client command `ALL RESTART -i` was executed while one data node was not running, all data nodes in the cluster were shut down. (Bug#24105)
- **NDB Cluster**: A query using an index scan followed by a delete operation, and then a rollback could cause one or more data nodes to crash. (Bug#24039)
- **NDB Cluster** (Cluster APIs): Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- **NDB Cluster**: It was possible for the sum of the `MaxNoOfTables`, `MaxNoOfOrderedIndexes`, and `MaxNoOfUnique-HashIndexes` configuration parameters, plus the number of system tables to exceed the maximum value for a `UInt32` number. In such a case, the cluster's data nodes failed to start, and no reason for this could easily be determined from the error messages provided. (Bug#22548)
- **NDB Cluster**: Given a table `mytbl` in a database `mydb` on a MySQL Server acting as an SQL node in a MySQL Cluster, then, following multiple `ALTER TABLE mytbl ENGINE=engine` statements — first, to change the storage engine used for a table to **NDB**, and then again to change the table to use a non-**NDB** storage engine — a `DROP DATABASE mydb` statement executed on any SQL node in the cluster would cause `mydb` to be dropped on *all* SQL nodes in the cluster, even if `mydb` contained non-**NDB** tables. (Bug#21495)
- **NDB Cluster**: An incorrect error message was displayed in the event that the value of the `MaxNoOfOrderedIndexes` parameter was set too low. (Bug#20065)
- **NDB Cluster**: An incorrect error message was displayed in the event that the value of the `DataMemory` parameter was insufficient for the amount of data to be stored by the cluster. (Bug#19808)
- **NDB Cluster**: A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. (Bug#18487, Bug#24303)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug#23504)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- The size of **MEMORY** tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- For debug builds, `mysqladmin shutdown` displayed an extraneous `skipped 9 bytes from file: socket (3)` message. (Bug#21428)
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug#20191)
- `CREATE FUNCTION X()` and `CREATE FUNCTION Y()` failed with a syntax error instead of warning the user that these function names are already used (for GIS functions). (Bug#21025)

- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug#22457)
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

(Bug#22052)

- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug#11927)
- `BENCHMARK`, `ENCODE`, `DECODE`, and `FORMAT` could only accept a constant for some parameters, and could not be used in prepared statements. (Bug#22684)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug#20327)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. (Bug#21466)
- In some cases, the parser failed to distinguish a user-defined function from a stored function. (Bug#21809)
- In some cases, a function that should be parsed as a user-defined function was parsed as a stored function. (Bug#24736)
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug#24056)
- `LAST_DAY('0000-00-00')` could cause a server crash. (Bug#23653)
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. (Bug#21635)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug#23383)
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- Instance Manager option-parsing code caused memory-allocation errors. (Bug#22242)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug#23651)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- The server source code had multiple exportable definitions of the `field_in_record_is_null()` function. These are now all declared `static`. (Bug#24190)
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. (Bug#21790)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug#19216)
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. (Bug#21727)
- SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than

`max_allowed_packet` that could not be read by slave servers. (Bug#19402)

- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. (Bug#21505)
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug#23478)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug#19491)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug#11032)
- Some unnecessary Valgrind warnings were removed from the server. (Bug#24488, Bug#24533).
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug#22413)
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug#20045)
- With row-based binary logging, replicated multiple-statement transaction deadlocks did not return the correct error code, causing the slave SQL thread to stop rather than roll back and re-execute. (Bug#23831)
- With row-based binary logging, for `CREATE TABLE IF NOT EXISTS LIKE temporary_table` statements, the `IF NOT EXISTS` clause was not logged. (Bug#22762)
- With row-based binary logging, `CREATE TABLE IF NOT EXISTS SELECT` statements were not logged properly. (Bug#22027)
- On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug#20697)
- Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug#20404)
- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. (Bug#23451)
- For view renaming, the table name to filename encoding was not performed. (Bug#21370)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- The XPath operators `<` and `>`, as implemented in the `ExtractValue()` function, operated in reverse. (Bug#22823)

C.1.16. Changes in MySQL 5.1.14 Carrier Grade Edition

This section contains change history information for MySQL Cluster 5.1 Carrier Grade Edition releases based on MySQL 5.1.14.

C.1.16.1. Changes in release MySQL 5.1.14-ndb-6.1.0-beta (20 December 2006)

This is a new Beta development release, fixing recently discovered bugs.

Like all releases for MySQL MySQL Cluster 5.1 Carrier Grade Edition, this is a source-only release which you must compile and install using the instructions found in [Section 2.9, “MySQL Installation Using a Source Distribution”](#), and in [Section 16.4.1, “Building MySQL Cluster from Source Code”](#). You can download the source code archive for this release from the MySQL FTP site at ftp://ftp.mysql.com/pub/mysql/download/cluster_telco/mysql-5.1.14-ndb-6.1.0. There are two version of the source archive in this dir-

ectory:

- [mysql-5.1.14-ndb-6.1.0-telco.tar.gz](#): This is the GPL version. Customers who are using MySQL MySQL Cluster 5.1 Carrier Grade Edition under a commercial licence must *not* use this version in a production setting.
- [mysqlcom-5.1.14-ndb-6.1.0-telco.tar.gz](#): This is the commercial version. Customers who are using MySQL MySQL Cluster 5.1 Carrier Grade Edition under a commercial licence *must* use this version in any setting covered under their licence agreement with MySQL AB.

NOTE: Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied in this Beta release since MySQL MySQL Cluster 5.1 Carrier Grade Edition diverged from MySQL 5.1.14 standard.

Functionality added or changed:

- Support was added for a new [MemReportFrequency](#) configuration parameter that provides for periodic reports of memory usage. See [Section 16.4.5.2, “Management Node Configuration Parameters”](#), for information about using this parameter.

Bugs fixed:

- **NDB API:** A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). ([Bug#25059](#))
- A [SELECT](#) statement performing a primary key lookup on a table with a [VARCHAR](#) primary key, and where a [BLOB](#) or [TEXT](#) column was among the columns selected, would produce an empty result set. ([Bug#19956](#))
- **NDB API:** When using the [NdbTransaction::execute\(\)](#) method, a very long timeout (greater than 5 minutes) could result if the last data node being polled was disconnected from the cluster. ([Bug#24949](#))
- **Disk Data:** A [MEDIUMTEXT](#) column of a Disk Data table was stored in memory rather than on disk, even if the column was not indexed. ([Bug#25001](#))
- Under certain rare circumstances, local checkpoints were not performed properly, leading to an inability to restart one or more data nodes. ([Bug#24664](#))
- **Disk Data:** Performing a node restart with a newly dropped Disk Data table could lead to failure of the node during the restart. ([Bug#24917](#))
- **Disk Data:** Repeated [CREATE](#), [DROP](#), or [TRUNCATE](#) in various combinations with system restarts between these operations could lead to the eventual failure of a system restart. ([Bug#21948](#))
- **Disk Data:** Extents that should have been available for re-use following a DROP TABLE operation were not actually made available again until after the cluster performed a local checkpoint. ([Bug#17605](#))
- When a data node was shut down using the management client [STOP](#) command, a connection event ([NDB_LE_Connected](#)) was logged instead of a disconnection event ([NDB_LE_Disconnected](#)). ([Bug#22773](#))
- **Disk Data:** When restoring from backup a cluster containing any Disk Data tables with hidden primary keys, a node failure resulted which could lead to a crash of the cluster. ([Bug#24166](#))
- **NDB API:** Invoking the [NdbTransaction::execute\(\)](#) method using execution type [Commit](#) and abort option [AO_IgnoreError](#) could lead to a crash of the transaction coordinator ([DBTC](#)). ([Bug#25090](#))
- **NDB API:** Due to an error in the computation of table fragment arrays, some transactions might not be executed from the correct starting point. ([Bug#24914](#))

C.1.17. Changes in release 5.1.13 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** The number of function names affected by `IGNORE_SPACE` was reduced significantly in MySQL 5.1.13, from about 200 to about 30. (For details about `IGNORE_SPACE`, see [Section 8.2.4, “Function Name Parsing and Resolution”](#).) This change improves the consistency of parser operation. However, it also introduces the possibility of incompatibility for old SQL code that relies on the following conditions:

- `IGNORE_SPACE` is disabled.
- The presence or absence of whitespace following a function name is used to distinguish between a built-in function and stored function that have the same name (for example, `PI()` versus `PI ()`).

For functions that are no longer affected by `IGNORE_SPACE` as of MySQL 5.1.13, that strategy no longer works. Either of the following approaches can be used if you have code that is subject to the preceding incompatibility:

- If a stored function has a name that conflicts with a built-in function, refer to the stored function with a schema name qualifier, regardless of whether whitespace is present. For example, write `schema_name.PI()` or `schema_name.PI ()`.
- Alternatively, rename the stored function to use a non-conflicting name and change invocations of the function to use the new name.

([Bug#21114](#))

- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

It should be noted that, in such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The recalculation code has now been fixed to ensure that the value of `--table-open-cache` is no longer increased automatically, and that a warning is now given only if some values had to be decreased due to operating system limits.

([Bug#21915](#))

- Binary distributions of MySQL 5.1.12 were built without support for partitioning. This has been corrected except for NetWare. ([Bug#23949](#))
- A change in the interfaces for the `INFORMATION_SCHEMA.FILES` table has made the table accessible to storage engines other than `NDB`. ([Bug#23013](#))
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. ([Bug#19660](#))
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. ([Bug#20100](#))
- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. ([Bug#21462](#))

Bugs fixed:

- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible

with any other version and must be recompiled. ([Bug#23427](#))

- Several string functions could return incorrect results when given very large length arguments. ([Bug#10963](#))
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. ([Bug#22158](#))
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. ([Bug#22584](#))
- `M % 0` returns `NULL`, but `(M % 0) IS NULL` evaluated to false. ([Bug#23411](#))
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement. ([Bug#20953](#))

Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. ([Bug#17039](#))
- `mysql` did not check for errors when fetching data during result set printing. ([Bug#22913](#))
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. ([Bug#21811](#))
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. ([Bug#23037](#))
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. ([Bug#23379](#))
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` option. ([Bug#22728](#))
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. ([Bug#22728](#))
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. ([Bug#21354](#))
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` within subqueries incorrectly clipped large values; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. ([Bug#11655](#), [Bug#20927](#))
- Range searches on columns with an index prefix could miss records. ([Bug#20732](#))
- With `SQL_MODE=TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. ([Bug#20028](#))
- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. ([Bug#20894](#))
- `mysqldump --xml` produced invalid XML for `BLOB` data. ([Bug#19745](#))
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. ([Bug#19356](#))
- Within a trigger for a base table, selecting from a view on that base table failed. ([Bug#19111](#))
- `DELETE IGNORE` could hang for foreign key parent deletes. ([Bug#18819](#))
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. ([Bug#4053](#))

- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- `InnoDB` showed substandard performance with multiple queries running concurrently. (Bug#15815)
- There was a race condition in the `InnoDB fil_flush_file_spaces()` function. (Bug#24098)
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31) - 1`, which it had previously. (Bug#9191)
- Some yaSSL-related memory leaks detected by Valgrind were fixed. (Bug#23981)
- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. (Bug#23254)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- The return value from `my_seek()` was ignored. (Bug#22828)
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. (Bug#21868)
- Use of a DES-encrypted SSL certificate file caused a server crash. (Bug#21868)
- Column names were not quoted properly for replicated views. (Bug#19736)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `InnoDB` crashed when trying to display an error message about a foreign key constraint violation when the two tables are in different schemas. (Bug#23368)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)
- At shutdown, Instance Manager told guarded server instances to stop, but did not wait until they actually stopped. (Bug#17486)
- It was not possible to do an atomic rename of the log tables without the possibility of losing rows. Now you can do this:

```
USE mysql;
CREATE TABLE IF NOT EXISTS general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

(Bug#17544, Bug#21785)

- **NDB Cluster** (Disk Data): In the event of an aborted multiple update, the space in the Disk Data log buffer to be freed as a result was actually freed twice, which could eventually lead to a crash. (Bug#23430)
 - **NDB Cluster**: An `NDB` source file included a `memset()` call with reversed arguments. (Bug#23169)
 - **NDB Cluster**: Under some conditions, the data distribution could become unbalanced in a MySQL Cluster with 2 or more node groups following the creation of a new table. (Bug#21690)
- As part of the fix for this bug, two new `NDB` API methods were added to the `NdbDictionary::Object::Table` class. See the MySQL Cluster API documentation for details.
- Incorrect warnings occurred for use of `CREATE TABLE ... LIKE` or `REPAIR TABLE` with the log tables. (Bug#21966)
 - MySQL failed to build on the Alpha platform. (Bug#23256)
 - The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. (Bug#22753)
 - The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. (Bug#22367)
 - The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
 - A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug#14019)

- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. (Bug#22342)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. (Bug#21798)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- The optimizer sometimes mishandled R-tree indexes for `GEOMETRY` data types, resulting in a server crash. (Bug#21888)
- An unhandled `NULL` pointer caused a server crash. (Bug#22138)
- Use of `SQL_BIG_RESULT` did not influence the sort plan for query execution. (Bug#22781)
- The server did not allocate sufficient memory for some queries for which a `DISTINCT` to `GROUP BY` conversion is possible and an `ORDER BY` clause is present, resulting in a server crash. (Bug#20503)
- The range analysis optimizer did not take into account predicates for which an index could be used after reading `const` tables. In some cases this resulted in non-optimal execution plans. (Bug#19579)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug#12240)
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug#23175)
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in `MyISAM` table corruption. (Bug#8283)
- `NDB Cluster`: Restoring a cluster failed if there were any tables with 128 or more columns. (Bug#23494, Bug#23502)
- `NDB Cluster`: Cluster backups would fail when there were more than 2048 schema objects in the cluster. (Bug#23499)
- `NDB Cluster`: The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. (Bug#23203)
- `NDB Cluster`: `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. (Bug#23200)
- `NDB Cluster`: If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug#22893)
- `NDB Cluster`: Multiple node restarts in rapid succession could cause a system restart to fail (Bug#22892), or induce a race condition (Bug#23210).
- `NDB Cluster`: Attempting to create a unique constraint with `USING HASH` on an `NDB` table caused `mysqld` to crash. (Bug#21873)
- `NDB Cluster`: When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. (Bug#21072)
- `NDB Cluster` (`NDB API`): When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updating the retrieved records, the scan could skip some records, which were not updated as the result. (Bug#20446)
- `NDB Cluster`: Aborting a cluster backup too soon after starting it caused a forced shutdown of the data nodes. (Bug#19148)

C.1.18. Changes in release 5.1.12 (24 October 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see [ht-](#)

[tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- **Incompatible change:** Support for the BerkeleyDB (BDB) engine has been dropped from this release. Any existing tables that are in BDB format will not be readable from within MySQL from 5.1.12 or newer. You should convert your tables to another storage engine *before* upgrading to 5.1.12.

Because of this change, the `SHOW [BDB] LOGS` statement has been dropped.

- **Incompatible change:** The namespace for scheduled events has changed, such that events are no longer unique to individual users. This also means that a user with the `EVENT` privilege on a given database can now view, alter, or drop any events defined on that database.

If you used scheduled events in an earlier MySQL 5.1 release, you should rename any of them having the same name and defined on the same database but belonging to different users — so that all events in a given database have unique names — *before* upgrading to 5.1.12 (or newer).

For additional information, see [Section 21.5, “The Event Scheduler and MySQL Privileges”](#).

- **Incompatible change:** The permitted values for and behaviour of the `event_scheduler` system variable have changed. Permitted values are now `ON`, `OFF`, and `DISABLED`, with `OFF` being the default. It is not possible to change its value to or from `DISABLED` while the server is running.

For details, see [Section 21.1, “Event Scheduler Overview”](#).

- **Incompatible change:** The plugin interface has changed: The `st_mysql_plugin` structure has a new `license` member to indicate the license type. (The allowable values are defined in `mysql/plugin.h`.) This change is not backward compatible, so the API version (`MYSQL_PLUGIN_INTERFACE_VERSION`) has changed. For additional information, see [Section 28.2.5, “Writing Plugins”](#).

- **Incompatible change:** The full-text parser plugin interface has changed in two ways:

- The `MYSQL_FTPARSER_PARAM` structure has a new `flags` member. This is zero if there are no special flags, or `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- The `mysql_parse()` and `mysql_add_word()` functions now take a `MYSQL_FTPARSER_PARAM` as their first argument, not a `MYSQL_FTPARSER_PARAM : mysql_ftparam` as before.

These changes are not backward compatible, so the API version (`MYSQL_FTPARSER_INTERFACE_VERSION`) has changed. For additional information, see [Section 28.2.5, “Writing Plugins”](#).

- **Incompatible change:** Storage engines can be pluggable at runtime, so the distinction between disabled and invalid storage engines no longer applies. This affects the `NO_ENGINE_SUBSTITUTION` SQL mode, as described in [Section 5.2.6, “SQL Modes”](#).
- **Incompatible change:** In the `INFORMATION_SCHEMA.EVENTS` table, the `EVENT_DEFINITION` column now contains the SQL executed by a scheduled event.

The `EVENT_BODY` column now contains the language used for the statement or statements shown in `EVENT_DEFINITION`. In MySQL 5.1, the value shown in `EVENT_BODY` is always `SQL`.

These changes were made to bring this table into line with the `INFORMATION_SCHEMA.ROUTINES` table, and that table's `ROUTINE_BODY` and `ROUTINE_DEFINITION` columns. ([Bug#16992](#))

- **Incompatible change:** MySQL Cluster node and system restarts formerly required that all fragments use the same local checkpoint (LCP); beginning with this version, it is now possible for different fragments to use different LCPs during restarts. This means that data node filesystems must be rebuilt as part of any upgrade to this version by restarting all data nodes with the `--initial` option. ([Bug#21271](#), [Bug#21478](#))

See [Section 16.5.2, “Cluster Upgrade and Downgrade Compatibility”](#), and related sections of the Manual before upgrading a MySQL Cluster to version 5.1.12 or later.

- **Incompatible change:** A number of MySQL constructs are now prohibited in partitioning expressions, beginning with this release. These include:

- A number of MySQL functions.

You can find [a complete list of these functions](#) under *Partitioning Limitations*.

- The bit operators `|`, `&`, `^`, `<<`, `>>`, and `~`.
- Nested function calls.
- Calls to stored routines, UDFs, or plugins.
- Character-to-integer conversions involving non-8-bit character sets or any of the `latin1_german2_ci`, `latin2_czech_cs`, or `cp1250_czech_cs` collations.

These restrictions were added in part as a result of [Bug#18198](#) and related bug reports.

For more information about these and other restrictions on partitioned tables in MySQL, see [Section 17.5, “Restrictions and Limitations on Partitioning”](#).

- Binary MySQL distributions no longer include a `mysqld-max` server. Instead, distributions contain a binary that includes the features previously included in the `mysqld-max` binary.
- The default binary log format (as used during replication) is now Mixed based, automatically using a combination of row-based and statement based log events as appropriate.
- The general query log and slow query logs now can be enabled or disabled at runtime with the `general_log` and `slow_query_log` system variables, and the name of the log files can be changed by setting the `general_log_file` and `slow_query_log_file` system variables. See [Section 5.11.3, “The General Query Log”](#), and [Section 5.11.5, “The Slow Query Log”](#).
- The output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as

```
<field name="column_name" xsi:nil="true" />
```

whereas a column containing the string value `'NULL'` is reported as

```
<field name="column_name">NULL</field>
```

and a column containing an empty string is reported as

```
<field name="column_name">>/field>
```

([Bug#21263](#))

- The following statements now can be executed as prepared statements (using `PREPARE` plus `EXECUTE`):

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
      | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

([Bug#20665](#))

- The Instance Manager `--passwd` option has been renamed to `--print-password-line`. Other options were added to enable management of the IM password file from the command line: `--add-user`, `--drop-user`, `--edit-user`, `--list-users`, `--check-password-file`, `--clean-password-file`, `--username`, and `--password`. The `--mysql-safe-compatible` option was added to cause the Instance Manager to act similarly to `mysqld_safe`.
- On Windows, typing Control-C caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. ([Bug#17926](#); see also [Bug#1989](#))
- `TEXT` and `BLOB` columns do not support `DEFAULT` values. However, when a default of `' '` was specified, the specification was silently ignored. This now results in a warning, or an error in strict mode. ([Bug#19498](#))
- The `mysql` client now allows `\l` in the `prompt` command argument to insert the current delimiter into the prompt. ([Bug#14448](#))
- Log table changes: By default, the log tables use the `CSV` storage engine, as before. But now the log tables can be altered to use the `MyISAM` storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than `CSV` or `MyISAM` are legal for the log tables. The use of `DROP TABLE` for log tables is similarly restricted: It cannot be used to drop a log table that is in use. The log must be disabled first. (These changes also correct a deadlock that occurred for an attempt to drop an in-use log table.) ([Bug#18559](#))
- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. ([Bug#11728](#))
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. ([Bug#14940](#))
- For `mysqlshow`, if a database name argument contains wildcard characters (such as `'_'`) but matches a single database name exactly, treat the name as a literal name. This allows a command such as `mysqlshow information_schema` work without having to escape the wildcard character. ([Bug#19147](#))
- If a `DROP VIEW` statement named multiple views, it stopped with an error if a non-existent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. ([Bug#16614](#))
- `SHOW CREATE TABLE` now shows constraints for `InnoDB` tables. ([Bug#16614](#))
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log files. ([Bug#18351](#))
- **NDB Cluster:** Backup messages are no longer printed to the Cluster log.
- **NDB Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `START` command. ([Bug#19620](#))
- **NDB Cluster:** Inserting into an `NDB` table failed when the table had no primary key but had a unique key added after table was created on one or more `NOT NULL` columns. This occurred when the unique key had been adding using either `ALTER TABLE` or `CREATE UNIQUE KEY`. ([Bug#22838](#))
- **NDB Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. ([Bug#22295](#))
- **NDB Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. ([Bug#22195](#))
- **NDB Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. ([Bug#20848](#))
- Added the `--ndb-use-copying-alter-table` option to `mysqld` to provide a fallback in case of problems with online `ALTER TABLE` operations on `NDBCluster` tables.
- Added the `SHOW CONTRIBUTORS` statement.
- It is no longer possible to create partitioned tables using the `CSV` storage engine.
- **NDB Cluster:** The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.

- **NDB Cluster**: A number of erroneous, misleading, or missing error messages have been corrected. ([Bug#17297](#) & [Bug#19543](#))
- **NDB Cluster**: It is no longer possible to create Cluster tables using any partitioning type other than [**LINEAR**] **KEY**. Attempting to do so now raises an error.
- The **ExtractValue()** function now produces an error when passed an XML fragment that is not well-formed. ([Bug#18201](#))
(Previously, the function allowed invalid XML fragments to be used.)
- There were several issues regarding how **SHOW STATUS** affected some status variables and logging which could impact monitoring the MySQL Server. The behavior of this statement has been modified in two ways:
 - **SHOW STATUS** is no longer logged to the slow query log.
 - **SHOW STATUS** no longer updates any session status variables, except for **com_show_status**.

However, **SHOW STATUS** continues to update *global* status variables to allow monitoring of what the server is actually doing. This is because **SHOW STATUS** creates temporary tables that may affect performance if it is called excessively often. ([Bug#10210](#), [Bug#19764](#))

- The **mysqldumps low** script has been moved from client RPM packages to server RPM packages. This corrects a problem where **mysqldumps low** could not be used with a client-only RPM install, because it depends on **my_print_defaults** which is in the server RPM. ([Bug#20216](#))
- The bundled yaSSL library was upgraded to version 1.3.7.
- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the [extra/yaSSL/FLOSS-EXCEPTIONS](#) file in a MySQL source distribution for details.) ([Bug#16755](#))
- **mysqlslap** threads now try to connect up to 10 times if the initial connect attempt fails. ([Bug#21297](#))
- For a successful dump, **mysqldump** now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

([Bug#10877](#))

- The **mysqld** and **mysqlmanager** manpages have been reclassified from volume 1 to volume 8. ([Bug#21220](#))
- In the **INFORMATION_SCHEMA.ROUTINES** table the **ROUTINE_DEFINITION** column now is defined as **NULL** rather than **NOT NULL**. Also, **NULL** rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. ([Bug#20230](#))
- **configure** now defines the symbol **DEBUG_ON** in **config.h** to indicate whether the source tree is configured to be compiled with debugging support. ([Bug#19517](#))
- The MySQL distribution now compiles on UnixWare 7.13. ([Bug#20190](#))
- The **mysql** client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the **mysql** command **charset** (or **\C**) that changes the default character set and now also issues a **SET NAMES** statement. The changed character set is used for re-connects. ([Bug#11972](#))
- The **STATE** column of the **INFORMATION_SCHEMA.PROCESSLIST** table was increased from 30 to 64 characters to accommodate longer state values. ([Bug#21652](#))
- **TIMESTAMP** columns that are **NOT NULL** now are reported that way by **SHOW COLUMNS** and **INFORMATION_SCHEMA**. ([Bug#20910](#))
- **INFORMATION_SCHEMA** contains new tables, **GLOBAL_STATUS**, **SESSION_STATUS**, **GLOBAL_VARIABLES**, and **SESSION_VARIABLES**, that correspond to the output from the **SHOW {GLOBAL|SESSION} STATUS** and **SHOW {GLOBAL|SESSION} VARIABLES** statements.
- The **BINARY** keyword now is forbidden as a data type attribute in stored routines (for example, **DECLARE v1 VARCHAR(25) BINARY**), because **DECLARE** does not support collations, and in this context **BINARY** specifies the binary collation of the variable's character set. ([Bug#20701](#))

- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See [Section 28.3.4.5, “Compiling and Installing User-Defined Functions”](#). (Bug#19121)
- `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. (Bug#11151)
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 12.6.2.2, “LOAD DATA FROM MASTER Syntax”](#), for recommended alternatives. (Bug#18822, Bug#9125, Bug#12187, Bug#14399, Bug#15025, Bug#20596)
- `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. (Bug#21424)
- The default value of the `tmp_table_size` system variable was lowered from 32MB to 16MB because it is bounded by the value of `max_heap_table_size`, which has a default of 16MB. (Bug#18875)
- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. (Bug#22268)
- Memory consumption of the `InnoDB` data dictionary cache was roughly halved by cleaning up the data structures. (Bug#20877)
- Using `--with-debug` to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. See [Section 5.10.9, “MySQL Server Locale Support”](#).

Bugs fixed:

- **Security fix:** On Linux, and possibly other platforms using case-sensitive filesystems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (CVE-2006-4226, Bug#17647)
- **Security fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. (CVE-2006-4031, Bug#15195)
- **Security fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. (CVE-2006-4227, Bug#18630)
- **Incompatible change:** For `utf8` columns, the full-text parser incorrectly considered several non-word punctuation and whitespace characters as word characters, causing some searches to return incorrect results. (Bug#19580)

The fix involves a change to the full-text parser, so any tables that have `FULLTEXT` indexes on `utf8` columns must be repaired with `REPAIR TABLE`:

```
REPAIR TABLE tbl_name QUICK;
```

- The `mysql_list_fields()` C API function returned the incorrect table name for views. (Bug#19671)
- An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. (Bug#6774)
- `InnoDB` locking was improved by removing a gap lock for the case that you try to delete the same row twice within a transaction. (Bug#13544)
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug#22384)

- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. (Bug#18874)
- `ALTER EVENT` statements including only a `COMMENT` clause failed with a syntax error on two platforms: Linux for S/390, and OS X 10.4 for 64-bit PPC. (Bug#23423)
- For row-based replication, log rotation could occur at an improper time. (Bug#21474)
- For row-based replication, the `BINLOG` command did not lock tables properly, causing a crash for some table types. (Bug#19459)
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. (Bug#14654)
- Incorrect type aggregation for `IN` and `CASE` expressions could lead to an incorrect result. (Bug#18360)
- When using row based replication, a `CREATE TABLE...SELECT` statement would be replicated, even if the table creation failed on the master (for example, due to a duplicate key failure). (Bug#20265)
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. (Bug#18165)
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug#21540)
- The `CSV` storage engine failed to detect some table corruption. (Bug#22080)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381)
- Successive invocations of a `COUNT(*)` query containing a join on two `MyISAM` tables and a `WHERE` clause of the form `WHERE (table1.column1 = table2.column2) OR table2.column2 IS NULL` yielded different results. (Bug#21019)
- It was possible to provide the `ExtractValue()` function with input containing “tags” that were not valid XML; for example, it was possible to use tag names beginning with a digit, which are disallowed by the W3C’s XML 1.0 specification. Such cases caused the function to return “junk” output rather than an error message signalling the user as to the true nature of the problem. (Bug#20854)
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be allowed. (Bug#21646)
- `BIT` columns were not replicated properly under row-based replication. (Bug#22550)
- Conversion of values inserted into a `BIT` column could affect adjacent columns. (Bug#22271)
- The URL into the online manual that is printed in the stack trace message by the server was out of date. (Bug#21449)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- `PROCEDURE ANALYSE()` returned incorrect values of `M FLOAT(M, D)` and `DOUBLE(M, D)`. (Bug#20305)
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. (Bug#19960)
- On an `INSERT` into an updatable but non-insertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. (Bug#5505)
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. (Bug#20627, Bug#20830)
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug#21620)
- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug#21853)
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default

value to be lost. (Bug#20108)

- An **UPDATE** that referred to a key column in the **WHERE** clause and activated a trigger that modified the column resulted in a loop. (Bug#20670)
- A loaded storage engine plugin did not load after a server restart. (Bug#21610)
- Creating a **TEMPORARY** table with the same name as an existing table that was locked by another client could result in a lock conflict for **DROP TEMPORARY TABLE** because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- After **FLUSH TABLES WITH READ LOCK** followed by **UNLOCK TABLES**, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414)
- **mysql_com.h** unnecessarily referred to the **ulong** type. (Bug#22227)
- Incorporated some portability fixes into the definition of **__attribute__** in **my_global.h**. (Bug#2717)
- Linking the **pthread** library to single-threaded MySQL libraries caused **dlopen()** to fail at runtime on HP-UX. (Bug#18267)
- Loading a plugin caused any an existing plugin with the same name to be lost. (Bug#20615)
- In the package of pre-built time zone tables that is available for download at <http://dev.mysql.com/downloads/timezones.html>, the tables now explicitly use the **utf8** character set so that they work the same way regardless of the system character set value. (Bug#21208)
- The build process incorrectly tried to overwrite **sql/lex_hash.h**. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. (Bug#18888)
- **mysql_ftdump** produced bad counts for common words. (Bug#22326)
- The optimizer could make an incorrect index choice for indexes with a skewed key distribution. (Bug#22393)
- When records are merged from the insert buffer and the page needs to be reorganized, **InnoDB** used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in **ROW_FORMAT=COMPACT** that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. (Bug#21638)
- Instance Manager didn't close the client socket file when starting a new **mysqld** instance. **mysqld** inherited the socket, causing clients connected to Instance Manager to hang. (Bug#12751)
- Using **GROUP_CONCAT()** on the result of a subquery in the **FROM** clause that itself used **GROUP_CONCAT()** could cause a server crash. (Bug#22015)
- Instance Manager had a race condition involving **mysqld** PID file removal. (Bug#22379)
- Execution of a prepared statement that uses an **IN** subquery with aggregate functions in the **HAVING** clause could cause a server crash. (Bug#22085)
- Selecting from a **MERGE** table could result in a server crash if the underlying tables had fewer indexes than the **MERGE** table itself. (Bug#21617, Bug#22937)
- A locking safety check in **InnoDB** reported a spurious error **stored_select_lock_type is 0 inside ::start_stmt()** for **INSERT ... SELECT** statements in **innodb_locks_unsafe_for_binlog** mode. The safety check was removed. (Bug#10746)
- **make install** tried to build files that should already have been built by **make all**, causing a failure if installation was performed using a different account than the one used for the initial build. (Bug#19738)
- The source distribution would not build on Windows due to a spurious dependency on **ib_config.h**. (Bug#22224)
- It was possible for a stored routine with a non-**latin1** name to cause a stack overrun. (Bug#21311)
- The server returns a more informative error message when it attempts to open a **MERGE** table that has been defined to use non-**MyISAM** tables. (Bug#10974)
- Within stored routines, some error messages were printed incorrectly. A non-null-terminated string was passed to a message-print-

ing routine that expected a null-terminated string. (Bug#20778)

- `SUBSTR()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. (Bug#20204)
- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. This was added while dealing with a problem of MySQL choosing the wrong index for some queries. (Bug#14940)
- On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted filesystem could return a non-standard return value, leading to data corruption. Now such calls are avoided. (Bug#12620)
- With `TRADITIONAL` SQL mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. (Bug#6147)
- The source distribution failed to compile when configured with the `--without-geometry` option. (Bug#12991)
- The source distribution failed to compile when configured with the `--with-libwrap` option. (Bug#18246)
- The feature of being able to recover a temporary table named `#sql_id` in InnoDB by creating a table named `rsql_id_recover_innodb_tmp_table` was broken by the introduction of the new identifier encoding in MySQL 5.1.6 (Bug#21313)
- `ALTER EVENT` in the body of a stored procedure led to a crash when the procedure was called. This affected only those `ALTER EVENT` statements which changed the interval of the event. (Bug#22397)
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. (Bug#21475)
- When a statement used a stored function that inserted into an `AUTO_INCREMENT` column, the generated `AUTO_INCREMENT` value was not written into the binary log, so a different value could in some cases be inserted on the slave. (Bug#20341)
- A stored procedure that used `LAST_INSERT_ID()` did not replicate properly using statement-based binary logging. (Bug#20339)
- Use of the `--no-pager` option caused `mysql` to crash. (Bug#19363)
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. (Bug#21555)
- When `event_scheduler` was set to `DISABLED`, its value was not displayed correctly by `SHOW VARIABLES` or `SELECT @@global.event_scheduler`. (Bug#22662)
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. (Bug#16081)
- If the binary logging format was changed between the times when a locked table was modified and when it was unlocked, the binary log contents were incorrect. (Bug#20863)
- Column names supplied for a view created on a master server could be lost on a slave server. (Bug#19419)
- For a `MyISAM` table locked with `LOCK TABLES ...WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. (Bug#20256)
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug#21392)
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. (Bug#21302)
- The `--collation-server` server option was being ignored. With the fix for this problem, if you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. (Bug#15276)
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug#21698)

- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug#21180)
- If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. (Bug#20573)
- Queries containing a subquery that used aggregate functions could return incorrect results. (Bug#16792)
- Row-based replication failed when the query cache was enabled on the slave. (Bug#17620)
- The `index_merge/Intersection` optimizer could have a memory overrun when the number of table columns covered by an index is sufficiently large, possibly resulting in a server crash. (Bug#16201)
- The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug#20536)
- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug#5500)
- An `InnoDB` mutex was not acquired and released under the same condition, leading to deadlock in some rare situations involving XA transactions. (Bug#21833)
- With row-based replication, replicating a statement to a slave where the table had additional columns relative to the master table did not work. (Bug#19069)
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. (Bug#19702)
- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. (Bug#21416)
- `mysqldump` did not add version-specific comments around `WITH PARSER` and `TABLESPACE ... STORAGE DISK` clauses for `CREATE TABLE` statements, causing the dump file to fail when loaded into older servers. (Bug#20841)
- `BIN()`, `OCT()`, and `CONV()` did not work with BIT values. (Bug#15583)
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509)
- The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug#21493)
- `UPGRADE` was treated as a reserved word, although it is not. (Bug#21772)
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were being truncated to 64 bytes. (Bug#21432) An additional fix was made in MySQL 5.1.18.
- Usernames have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. (Bug#20393)
- A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. (Bug#16249)
- `COUNT(*)` queries with `ORDER BY` and `LIMIT` could return the wrong result. (Bug#21787)

Note

This problem was introduced by the fix for Bug#9676, which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

- Memory overruns could occur for certain kinds of subqueries. (Bug#21477)
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. (Bug#21456)
- Memory used by scheduled events was not freed when the events were dropped. (Bug#18683)

- A scheduled event that took longer to execute than the length of time scheduled between successive executions could “skip” executions. For example, an event defined with `EVERY 1 SECOND` — but which required longer than 1 second to complete — might be executed only once every 2 seconds. (Bug#16417)
- When used in the `DO` clause of a `CREATE EVENT` statement, the statements `CREATE EVENT`, `CREATE FUNCTION`, and `CREATE PROCEDURE` caused the server to crash. (These statements are not permitted inside `CREATE EVENT`.) (Bug#16409, Bug#18896)
- A subselect used in the `ON SCHEDULE` clause of a `CREATE EVENT` or `ALTER EVENT` statement caused the server to crash, rather than producing an error as expected. (Bug#16394)
- `mysql` displayed an empty string for `NULL` values. (Bug#21618)
- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. (Bug#21011)
- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. (Bug#21239)
- `yaSSL` had a conflicting definition for `socklen_t` on `hurd-i386` systems. (Bug#22326)
- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. (Bug#20789)
- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913)
- If a partitioned `InnoDB` table contained an `AUTO_INCREMENT` column, a `SHOW` statement could cause an assertion failure with more than one connection. (Bug#20493)
- Running `InnoDB` with many concurrent threads could cause memory corruption and a seg fault due to a bug introduced in MySQL 5.1.11. (Bug#20213)
- Using `DROP TABLE` with concurrent queries causes `mysqld` to crash. (Bug#21784)
- The `ExtractValue()` function did not accept XML tag names containing a period (`.`) character. (Bug#20795)
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug#17939)
- Identifiers with embedded escape characters were not handled correctly by some `SHOW` statements due to some old code that was doing some extra unescaping. (Bug#19874)
- `InnoDB` was slow with more than 100,000 `.idb` files. (Bug#21112)
- `SHOW INNODB STATUS` contained some duplicate output. (Bug#21113)
- After an `INSERT ... ON DUPLICATE KEY UPDATE` statement that updated an existing row, `LAST_INSERT_ID()` could return a value not in the table. (Bug#11460)
- Selecting from `INFORMATION_SCHEMA.FILES` could crash the server. (Bug#21676)
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. (Bug#19834)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available. (Bug#9678)
- Using `ALTER TABLE ... REORGANIZE PARTITIONS` to reduce the number of subpartitions to 1 caused the server to crash. (Bug#21210)
- **NDB Cluster**: The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. (Bug#21204)
- **NDB Cluster**: Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding of nodes in single user mode is no longer possible. (Bug#20395)
- **NDB Cluster**: Attempting to create an `NDB` table on a MySQL with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. Now, if such a table is encountered during autodiscovery, a warning is written to the

error log of the affected `mysqld`, and the local table is overwritten. ([Bug#21378](#))

- **NDB Cluster** (NDB API): Inactivity timeouts for scans were not correctly handled. ([Bug#23107](#))
- **NDB Cluster** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. ([Bug#22672](#))
- **NDB Cluster** (NDB API): The inclusion of `my_config.h` in `NdbApi.h` required anyone wishing to write NDB API applications against MySQL 5.1 to have a complete copy of the 5.1 sources. ([Bug#21253](#))
- **NDB Cluster** (NDB API): The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. ([Bug#21036](#))
- **NDB Cluster**: The `--help` output from NDB binaries did not include file-related options. ([Bug#21994](#))
- **NDB Cluster**: The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. ([Bug#21756](#))
- **NDB Cluster**: The output for the `--help` option used with NDB executable programs (`ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and so on) referred to the `Ndb.cfg` file, instead of `my.cnf`. ([Bug#21585](#))
- **NDB Cluster**: Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas. ([Bug#21535](#))

Note

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

- **NDB Cluster**: The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. ([Bug#21530](#))
- **NDB Cluster**: Cluster logs were not rotated following the first rotation cycle. ([Bug#21345](#))
- **NDB Cluster**: Condition pushdown did not work correctly with `DATETIME` columns. ([Bug#21056](#))
- **NDB Cluster**: Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. ([Bug#20895](#))
- **NDB Cluster**: Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. ([Bug#20575](#))
- **NDB Cluster**: In some cases where `SELECT COUNT(*)` from an NDB table should have yielded an error, `MAX_INT` was returned instead. ([Bug#19914](#))
- **NDB Cluster**: Following the restart of an MGM node, the Cluster management client did not automatically reconnect. ([Bug#19873](#))
- **NDB Cluster**: Error messages given when trying to make online changes parameters such as `NoOfReplicas` that can only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. ([Bug#19787](#))
- **NDB Cluster**: `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. ([Bug#19651](#))
- **NDB Cluster**: In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. ([Bug#19198](#))
- **NDB Cluster**: `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. ([Bug#19047](#))
- **NDB Cluster**: The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. ([Bug#19045](#))
- **NDB Cluster**: A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. This also adversely affected Cluster Replication. ([Bug#15303](#))
- **NDB Cluster**: Some queries involving joins on very large NDB tables could crash the MySQL server. ([Bug#21059](#))

- **NDB Cluster** (Disk Data): `mysqldump` did not back up tablespace or log file group information for Disk Data tables correctly. (Specifically, `UNDO_BUFFER_SIZE` and `INITIAL_SIZE` values were misreported.) Trying to restore from such a backup would produce error 1296 (`GOT ERROR 1504 'OUT OF LOGBUFFER MEMORY' FROM NDB`). (Bug#20809)
- **NDB Cluster** (Disk Data): The `INFORMATION_SCHEMA.FILES` table showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns for UNDO log files. (Bug#20073)
- **NDB Cluster** (Disk Data): Deletes from Disk Data tables used a non-optimal scan to find the rows to be deleted, resulting in poor performance. The fix causes disk order rather than memory order to be used, and can improve performance of Disk Data deletes by up to ~300% in some cases. (Bug#17929)
- **NDB Cluster**: A scan timeout returned Error 4028 (`NODE FAILURE CAUSED ABORT OF TRANSACTION`) instead of Error 4008 (`NODE FAILURE CAUSED ABORT OF TRANSACTION...`). (Bug#21799)
- **NDB Cluster**: The message `ERROR 0 IN READAUTOINCREMENTVALUE(): NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. (Bug#21033)
- **NDB Cluster** (Direct APIs): The `storage/ndb` directory was missing from the server binary distribution, making it impossible to compile NDB API and MGM API applications. This directory can be found as `/usr/include/storage/ndb` after installing that distribution. (Bug#21955)
- **NDB Cluster**: `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug#20426)
- The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. (Bug#21058)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug#13717)
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. (Bug#20695)
- If a query had a condition of the form `tableX.key = tableY.key`, which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. (Bug#19649)
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `CONST` tables. This resulted in choosing extremely inefficient execution plans in some cases when distribution of data in joins were skewed. (Bug#21390)
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. (Bug#21282)
- `STR_TO_DATE()` sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. (Bug#20987)
- On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. (Bug#16513)
- The `myisam_stats_method` variable was mishandled when set from an option file or on the command line. (Bug#21054)
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. (Bug#21159)
- **InnoDB** did not honor `IGNORE INDEX`, which prevented using `IGNORE INDEX` in cases where an index sort would be slower than a filesort. (Bug#21174)
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. (Bug#20411)
- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86_64 builds are not affected. (Bug#22238)
- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. (Bug#21774)
- Some user-level errors were being written to the server's error log, which is for server errors. (Bug#20402)
- to the client could have an empty column name. When using tables created under MySQL 4.1 with a 5.0 server, if the tables con-

tained `VARCHAR` columns, for some queries the metadata sent to the client could have an empty column name. (Bug#14897)

- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. (Bug#19741)
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. (Bug#16861)
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`' '`). (Bug#17313)
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug#16255)
- When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. (Bug#15950)
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the one that caused the error. (Bug#8153)
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. (Bug#21930)
- Queries that used the `index_merge` and `sort_union` methods to access an `InnoDB` table could produce inaccurate results. This issue was introduced in MySQL 5.1.10 when a new handler and bitmap interface was implemented. (Bug#21277)
- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. (Bug#21261)

Note

This fixes a regression that was introduced by the fix for Bug#20989.

- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. (Bug#21965)
- Building `mysql` on Windows with CMake 2.4 would fail to create `libmysqld` correctly. (Bug#20907)
- The server's handling of the number of partitions or subpartitions specified in a `PARTITIONS` or `SUBPARTITIONS` clause was changed. Beginning with this release, the number of partitions must:
 - be a positive, non-zero integer
 - not have any leading zeroes
 - not be an expression

Also beginning with this version, no attempt is made to convert, truncate, or evaluate a `PARTITIONS` or `SUBPARTITIONS` value; instead, the `CREATE TABLE` or `ALTER TABLE` statement containing the `PARTITIONS` or `SUBPARTITIONS` clause now fails with an appropriate error message. (Bug#15890)

- A misleading error message was displayed when attempting to define a unique key that was not valid for a partitioned table. (Bug#21862)
- Errors could be generated during the execution of certain prepared statements that ran queries on partitioned tables. (Bug#21658)
- Using relative paths for `DATA DIRECTORY` or `INDEX DIRECTORY` with a partitioned table generated a warning rather than an error, and caused “junk” files to be created in the server's data directory. (Bug#21350)
- Using `EXPLAIN PARTITIONS` with a query on a table whose partitioning expression was based on the value of a `DATE` column could sometimes cause the server to crash. (Bug#21339)
- Running `SHOW TABLE STATUS` on any `InnoDB` table having at least one record could crash the server. Note that this was not due to any issue in the `InnoDB` storage engine, but rather with `AUTO_INCREMENT` handling in the partitioning code — however, the table did not have to have an `AUTO_INCREMENT` column for the bug to manifest. (Bug#21173)
- Some `ALTER TABLE` statements affecting a table's subpartitioning could hang. (Bug#21143)
- Scheduled events that invoked stored procedures executing DDL operations on partitioned tables could crash the server.

[Bug#20548](#))

- The yaSSL library bundled with `libmysqlclient` had some conflicts with OpenSSL. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](#))
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause. However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read-only. ([Bug#17766](#))
- User-created tables having a name beginning with `#sql` were not visible to `SHOW TABLES` and could collide with internal temporary table names. Now they are not hidden and do not collide. ([Bug#1405](#))
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. ([Bug#21813](#))
- `mysql_upgrade` created temporary files in a possibly insecure way. ([Bug#21224](#))
- Some prepared statements caused a server crash when executed a second time. ([Bug#21166](#))
- With `query_cache_type` set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and non-blocking. ([Bug#21051](#))
- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently issuing `DROP TABLE` (or `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock) in another connection, the server crashed. ([Bug#19403](#), [Bug#21216](#))
- Use of zero-length variable names caused a server crash. ([Bug#20908](#))
- Prepared statements caused general log and server memory corruption. ([Bug#14346](#))
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. ([Bug#21527](#))
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. ([Bug#17485](#))
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. ([Bug#15205](#))
- `CREATE USER` did not respect the 16-character username limit. ([Bug#10668](#))
- Creating a partitioned table that used the `InnoDB` storage engine and then restarting `mysqld` with `--skip-innodb` caused MySQL to crash. ([Bug#20871](#))
- In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. ([Bug#20930](#))
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. ([Bug#21269](#))
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. ([Bug#20060](#))
- In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. ([Bug#20930](#))
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table. ([Bug#19370](#))

This patch was reverted in MySQL 5.1.18.

- The dropping of a temporary table whose name contained a backtick (```) character was not correctly written to the binary log, which also caused it not to be replicated correctly. ([Bug#19188](#))
- Intermediate tables created during the execution of an `ALTER TABLE` statement were visible in the output of `SHOW TABLES`. ([Bug#18775](#))

- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug#14770)
- The `--with-collation` option was not honored for client connections. (Bug#7192)
- Users who had the `SHOW VIEW` privilege for a view and privileges on one of the view's base table could not see records in `INFORMATION_SCHEMA` tables relating to the base table. (Bug#20543)
- An issue with yaSSL prevented Connector/J clients from connecting to the server using a certificate. (Bug#19705)
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug#16581)
- `FEDERATED` tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. (Bug#18764)
- The C API failed to return a status message when invoking a stored procedure. (Bug#15752)
- `AUTHORS` and `CONTRIBUTORS` were not treated as reserved words. (Bug#19939)
- Stored procedures did not use the character set defined for the database in which they were created. (Bug#16676)
- `CREATE PROCEDURE`, `CREATE FUNTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. (Bug#20438)
- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. (Bug#19207)
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) AT LINE 2: GOT ERROR 10000 'ERROR ON REMOTE SYSTEM: 1054: UNKNOWN COLUMN 'STRING-VALUE' FROM FEDERATED.` This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) (Bug#17608)
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. (Bug#21013)
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. (Bug#19399)
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. (Bug#21396)
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug#10946)
- The value returned by a stored function returning a string value was not of the declared character set. (Bug#16211)
- `FLUSH TABLES` followed by a `LOCK TABLES` statement to lock a log table and a non-log table caused an infinite loop and high CPU use. Now `FLUSH TABLES` ignores log tables. To flush the log tables, use `FLUSH LOGS` instead. (Bug#20139)
- If a filename was specified for the `--log` or `--log-slow_queries` options but the server was logging to tables and not files, the server produced no error message. (Bug#17599)
- `mysqlcheck` tried to check views instead of ignoring them. (Bug#16502)
- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug#15811)
- For `mysql`, escaping with backslash sometimes did not work. (Bug#20103)
- Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()/MAX()` optimization. (Bug#20954)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. (Bug#20792)
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. (Bug#21019)

- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. (Bug#16881)
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug#10979)
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. (Bug#20975)
- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug#7498)
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. (Bug#20466)
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. (Bug#18925)
- `InnoDB`: Quoted Unicode identifiers were not handled correctly. This included names of tables, columns, and foreign keys. (Bug#18800)
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. (Bug#17843)
- Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug#17526)
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. (Bug#17225)
- When performing a `GROUP_CONCAT()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. (Bug#16712)
- The type of the value returned by the `VARIANCE()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. (Bug#10966)
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash (Bug#21086).
- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
  t2 JOIN (
    t3 NATURAL JOIN t4,
    t5 NATURAL JOIN t6
  )
  ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

(Bug#21007)

- `myisam_ftdump` would fail when trying to open a MyISAM index file that you did not have write permissions to access, even though the command would only be reading from the file. (Bug#17122)
- `REPLACE ... SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. (Bug#20989)
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. (Bug#21014)
- With mixed-format binary logging, `INSERT DELAYED` statements were logged using statement-based logging, and they did not replicate properly for statements that used values such as `UUID()`, `RAND()`, or user-defined variables that require row-based logging. To correct this, the `DELAYED` handler thread now switches to row-based logging if the logging format is mixed. (Bug#20633, Bug#20649)
- Using `EXPLAIN PARTITIONS` with a `UNION` query could crash the server. This could occur whether or not the query actually used any partitioned tables. (Bug#20484)
- Partition pruning could cause incorrect results from queries, such missing rows, when the partitioning expression relied on a `BIGINT UNSIGNED` column. (Bug#20257)
- The implementation for `UNCOMPRESS()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. (Bug#18539)

- `TIMESTAMPDIFF()` examined only the date and ignored the time when the requested difference unit was months or quarters. (Bug#16226)
- `perror` did not properly report NDB error codes. (Bug#16561)
- `mysqlimport` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. (Bug#15690)
- The character set was not being properly initialized for `CAST()` with a type like `CHAR(2) BINARY`, which resulted in incorrect results or even a server crash. (Bug#17903)
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to allow column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug#8143)
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug#21215)
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. (Bug#21080)
- `mysql` crashed for very long arguments to the `connect` command. (Bug#21042)
- `perror` crashed on Solaris due to `NULL` return value of `strerror()` system call. (Bug#20145)
- The `query` command for `mysqltest` did not work. (Bug#19890)
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug#20868)
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. (Bug#19862)
- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. (Bug#21002)
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. (Bug#21231)
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. (Bug#20664)
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. (Bug#20570)
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day `'9999-12-31'`. (Bug#12356)
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. (Bug#20152)
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug#8706)
- If the files for an open table were removed at the OS level (external to the server), the server exited with an assertion failure. (Bug#16532)
- Some memory leaks in the `libmysqld` embedded server were corrected. (Bug#16017)
- With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. (Bug#20524)
- If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) (Bug#20188)

- `mysqlslap` did not enable the `CLIENT_MULTI_RESULTS` flag when connecting, which is necessary for executing stored procedures. (Bug#20365)
- When creating a table using `CREATE ... SELECT` and a stored procedure, there would be a mismatch between the binary log and transaction cache which would cause a server crash. (Bug#21039)
- When run with the `--use-threads` option, `mysqlimport` returned a random exit code. (Bug#21188)
- The effect of a stored function or trigger that caused `AUTO_INCREMENT` values to be generated for multiple tables was not logged properly if statement-based logging was used. Only the first table's value was logged, causing replication to fail. Under mixed logging format, this is dealt with by switching to row-based logging for the function or trigger. For statement-based logging, this remains a problem. (Bug#19630)
- Changing the definition of a `DECIMAL` column with `ALTER TABLE` caused loss of column values. (Bug#18014)
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption. Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. (This applies both to stored procedure and C API cursors.) (Bug#21206)
- A race condition during slave server shutdown caused an assert failure. (Bug#20850)
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug#20221)
- Partitions were represented internally as the wrong data type, which led in some cases to failures of queries such as `SELECT COUNT(*) FROM INFORMATION_SCHEMA.PARTITIONS WHERE PARTITION_NAME = 'partition_name'`. (Bug#20340)
- Searches against a `ZEROFILL` column of a partitioned table could fail when the `ZEROFILL` column was part of the table's partitioning key. (Bug#20733)
- In mixed binary logging mode, a temporary switch from statement-based logging to row-based logging occurs when storing a row that uses a function such as `UUID()` into a temporary table. However, temporary table changes are not written to the binary log under row-based logging, so the row does not exist on the slave. A subsequent select from the temporary table to a non-temporary table using statement-based logging works correctly on the master, but not on the slave where the row does not exist. The fix for this is that replication does not switch back from row-based logging to statement-based logging until there are no temporary tables for the session. (Bug#20499)
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. (Bug#15217)
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. (Bug#17203)
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. (Bug#16494)
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. (Bug#18080)
- Closing of temporary tables failed if binary logging was not enabled. (Bug#20919)
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long usernames or hostnames could cause a buffer overflow. (Bug#16899)
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write a SQL comment containing the view definition to the dump output. (Bug#17371)
- **InnoDB** (Partitioning): Updating an **InnoDB** table using `HASH` partitioning with a composite primary key would cause the server to hang. (Bug#20852)
- Old partition and subpartition files were not always removed following `ALTER TABLE ... REORGANIZE PARTITION` statements. (Bug#20770)
- Merging multiple partitions having subpartitions into a single partition with subpartitions, or splitting a single partition having subpartitions into multiple partitions with subpartitions, could sometimes crash the server. These issues were associated with a failure reported in the `partition_range` test. (Bug#20766, Bug#20767, Bug#20893, Bug#21357)

- Some queries using `ORDER BY ... DESC` on subpartitioned tables could crash the server. (Bug#20389)
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. (Bug#18444)
- For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. (Bug#18437)
- For multiple `INSERT DELAYED` statements executed in a batch by the delayed-insert handler thread, not all rows were written to the binary log. (Bug#20821)
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database now are disallowed. (Bug#18005, Bug#18361)
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. (Bug#16674, Bug#18359)
- Very complex `SELECT` statements could create temporary tables that were too big, but for which the temporary files did not get removed, causing subsequent queries to fail. (Bug#11824)
- Multiple-table updates with `FEDERATED` tables could cause a server crash. (Bug#19773)
- On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. (Bug#18235)
- Renaming a database to itself caused a server crash. (Bug#19392)
- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug#10166)
- Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. (Bug#16611, Bug#16218, Bug#17294)
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug#14400)
- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. (Bug#19835)
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. (Bug#17877)
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. (Bug#17199)
- `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. (Bug#15298)
- Portions of statements related to partitioning were not surrounded by version-specific comments by `mysqldump`, breaking backwards compatibility for dump files. (Bug#19488)
- A `DELETE FROM table` with no `WHERE` clause (deleting all rows) running concurrently with `INSERT` statements on a storage engine with row-level locking (such as `NDB`) could produce inconsistent results when using statement-based replication. (Bug#19066)
- Concatenating the results of multiple constant subselects produced incorrect results. (Bug#16716)
- The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. (Bug#18206)
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. (Bug#19789)
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug#16458)
- A buffer overwrite error in Instance Manager caused a crash. (Bug#20622)
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. (Bug#19634)

- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. ([Bug#18275](#))
- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](#))
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](#))
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. ([Bug#9676](#))
- Queries on tables that were partitioned by `KEY` and had a `VARCHAR` column as the partitioning key produced an empty result set. ([Bug#20086](#))
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. ([Bug#16377](#))
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. ([Bug#14896](#))
- A prepared statement that altered partitioned table within a stored procedure failed with the error `UNKNOWN PREPARED STATEMENT HANDLER`. ([Bug#17138](#))
- A query selecting records from a single partition of a partitioned table and using `ORDER BY ic DESC` (where `ic` represents an indexed column) could cause errors or crash the server. ([Bug#20583](#))
- **NDB Cluster** (Disk Data): On some platforms, `ndbd` compiled with `gcc 4` would crash when attempting to run `CREATE LOG-FILE GROUP`. ([Bug#21981](#))
- **NDB Cluster**: Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](#))
- **NDB Cluster**: Data was stored unevenly between partitions due to all `BLOB` data being placed in partition 0. ([Bug#21690](#))
- **NDB Cluster**: The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. ([Bug#21615](#))
- **NDB Cluster**: A partial rollback could lead to node restart failures. ([Bug#21536](#))
- **NDB Cluster**: The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. ([Bug#21384](#))
- **NDB Cluster**: In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in its nodegroup to shut down. ([Bug#21213](#))
- **NDB Cluster**: When the redo buffer ran out of space, a `POINTER TOO LARGE` error was raised and the cluster could become unusable until restarted with `--initial`. ([Bug#20892](#))
- **NDB Cluster**: In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP DETECTED`. ([Bug#20904](#))
- **NDB Cluster**: A vague error message was returned when reading of both schema files occurred during a restart of the cluster. ([Bug#20860](#))
- **NDB Cluster**: The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. ([Bug#20708](#))
- **NDB Cluster**: The server failed with a non-descriptive error message when out of data memory. ([Bug#18475](#))
- **NDB Cluster** (Direct APIss): Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. ([Bug#21671](#))
- **NDB Cluster**: The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. ([Bug#13985](#))
- **NDB Cluster** (Disk Data): Trying to create a Disk Data table using a nonexistent tablespace or trying to drop a nonexistent data file from a tablespace produced an uninformative error message. ([Bug#21751](#))

- **NDB Cluster** (Disk Data): Errors could occur when dropping a data file during a node local checkpoint. (Bug#21710)
- **NDB Cluster** (Disk Data): Creating a tablespace and log file group, then attempting to restart the cluster without using the `-initial` option and without having created any Disk Data tables could cause a forced shutdown of the cluster and raise a configuration error. (Bug#21172)
- **NDB Cluster**: Responses to the ALL DUMP 1000 management client command were printed multiple times in the cluster log for each cluster node. (Bug#21044)
- A memory leak was found when running `ndb_mgm -e "SHOW"`. (Bug#21670)
- **NDB Cluster** (Direct APIs): The MGM API function `ndb_logevent_get_fd()` was not actually implemented. (Bug#21129)
- **NDB Cluster**: Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. (Bug#21017, Bug#21050)
- **NDB Cluster**: A cluster data node could crash when an ordered index became full before the table containing the index was full. (Bug#14935)
- **NDB Cluster**: The repeated creating and dropping of a table would eventually lead to NDB Error 826, `TOO MANY TABLES AND ATTRIBUTES ... INSUFFICIENT SPACE`. (Bug#20847)
- **NDB Cluster**: `REPLACE` statements did not work correctly on an NDB table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug#20728)
- **NDB Cluster**: Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug#18781)
- **NDB Cluster**: A race condition could in some circumstances following a `DROP TABLE`. (Bug#20897)
- **NDB Cluster**: Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. (Bug#20419)
- **NDB Cluster**: When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. (Bug#19645)
- **NDB Cluster**: The `DATA_LENGTH` and `AVG_ROW_LENGTH` columns of the `INFORMATION_SCHEMA.TABLES` table did not report the size of variable-width column values correctly. (Bug#18413)

See Section 23.2, “The `INFORMATION_SCHEMA.TABLES` Table”, for more information.
- **NDB Cluster**: When attempting to restart the cluster following a data import, the cluster would fail during Phase 4 of the restart with `ERROR 2334: JOB BUFFER CONGESTION`. (Bug#20774)
- **NDB Cluster**: A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug#20197)
- **NDB Cluster**: It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. (Bug#19164)
- **NDB Cluster** (Replication): In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many NDB API clients making simultaneous event subscriptions or unsubscriptions. (Bug#20683)
- **NDB Cluster** (Direct APIs): `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the `batch` parameter. (Bug#20252)
- **NDB Cluster**: Cluster system status variables were not updated. (Bug#11459)
- **NDB Cluster** (Disk Data): Trying to create Disk Data tables when running the cluster in diskless mode would crash the cluster's data nodes. (Bug#20008)

Note

Disk Data tables are now disabled when running in diskless mode.

- **NDB Cluster** (Disk Data): A data file created on one tablespace could be dropped using `ALTER TABLESPACE ... DROP DATAFILE` on a different tablespace. (Bug#20053)
- **NDB Cluster**: Truncating a table on one `mysqld` caused other `mysqld` processes in the cluster to return `ERROR 1412 (HY000): TABLE DEFINITION HAS CHANGED, PLEASE RETRY TRANSACTION` on subsequent queries. (Bug#20705)
- **NDB Cluster**: The cluster's data nodes would fail while trying to load data when `NoOfFrangmentLogFiles` was equal to 1. (Bug#19894)
- **NDB Cluster**: A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. (Bug#19202)
- **NDB Cluster**: Restarting a failed node could crash the cluster. (Bug#18782)
- **NDB Cluster** (Disk Data): The failure of a `CREATE TABLESPACE` or `CREATE LOGFILE GROUP` statement did not revert all changes made prior to the point of failure. (Bug#16341)
- **NDB Cluster**: Creating tables with variable-size columns caused `DataMemory` to be used but not freed when the tables were dropped. (Bug#20007)
- **NDB Cluster**: Restoring a backup made using `ndb_restore` failed when the backup had been taken from a cluster whose data memory was full. (Bug#19852)
- **NDB Cluster**: An excessive number of `ALTER TABLE` operations could cause the cluster to fail with NDB error code 773 (`OUT OF STRING MEMORY, PLEASE MODIFY STRINGMEMORY`). (Bug#19275)
- **NDB Cluster**: `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. (Bug#19906)
- **NDB Cluster**: Running out of `DataMemory` could sometimes crash `ndbd` and `mysqld` processes. (Bug#19185)
- **NDB Cluster** (Replication): A node failure could send duplicate events, causing a `mysqld` replicating tables containing `BLOBs` to crash.
- **NDB Cluster** (Disk Data): `INFORMATION_SCHEMA.FILES` records for `UNDO` files showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns. (Bug#20073)
- **NDB Cluster**: An internal formatting error caused some management client error messages to be unreadable. (Bug#20016)
- **NDB Cluster**: Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. (Bug#19932)
- **NDB Cluster** (NDBAPI): Update operations on blobs were not checked for illegal operations.

Note

Read locks with blob update operations are now upgraded from read committed to read shared.

- **NDB Cluster**: The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). (Bug#18966)
- **NDB Cluster**: Renaming of table columns was not supported as fast a `ALTER TABLE` for NDB tables. (Bug#20456)
- **NDB Cluster**: Under some circumstances, repeated DDL operations on one `mysqld` could cause failure of a second `mysqld` attached to the same cluster. (Bug#19770)
- **NDB Cluster** (Replication): One or more of the `mysqld` processes could fail when subjecting a Cluster replication setup with multiple `mysqld` processes on both the master and slave clusters to high loads. (Bug#19768)
- **NDB Cluster**: `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug#19496)
- **NDB Cluster**: Repeated `CREATE - INSERT - DROP` operations tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug#18595)
- **NDB Cluster** (Disk Data): Running a large number of scans on Disk Data could cause subsequent scans to perform poorly.

[Bug#20334](#))

- **NDB Cluster** (Disk Data): An issue with disk allocation could sometimes cause a forced shutdown of the cluster when running a mix of memory and Disk Data tables. ([Bug#18780](#))
- **NDB Cluster**: The `mgm` client command `ALL CLUSTERLOG STATISTICS=15;` had no effect. ([Bug#20336](#))
- **NDB Cluster**: Under certain conditions, a starting node could miss transactions, leading to inconsistencies between the primary and backup replicas. ([Bug#19929](#))
- **NDB Cluster**: An uncommitted row could sometimes be checkpointed and thus incorrectly included in a backup. ([Bug#19928](#))
- **NDB Cluster**: A `DELETE` of many rows immediately followed by an `INSERT` on the same table could cause the `ndbd` process on the backup replica to crash. ([Bug#19293](#))
- **NDB Cluster**: `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. ([Bug#18864](#))
- **NDB Cluster**: `SELECT ... FOR UPDATE` failed to lock the selected rows. ([Bug#18184](#))
- **NDB Cluster**: New `mysqld` processes were allowed to connect without a restart of the cluster, causing the cluster to crash. ([Bug#13266](#))
- **NDB Cluster**: The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. ([Bug#20185](#))
- **NDB Cluster**: Renaming a table in such a way as to move it to a different database failed to move the table's indexes. ([Bug#19967](#))
- **NDB Cluster**: `SHOW ENGINE NDB STATUS` could sometimes return an incorrect value of `0` for the latest epoch, which could cause problems with synchronising the binlog. ([Bug#20142](#))
- **NDB Cluster**: A `CREATE TABLE` statement involving foreign key constraints raised an error rather than being silently ignored (see [Section 12.1.10, "CREATE TABLE Syntax"](#)). ([Bug#18483](#))

This bug affected Cluster in MySQL 5.1 only.

- **NDB Cluster** (Replication): Data definition and data manipulation statements on different tables were not serialised correctly in the binlog. For example, there was no guarantee that a `CREATE TABLE` statement and an update on a different table would occur in the same order in the binlog as they did on the cluster being replicated. ([Bug#18947](#))
- **NDB Cluster**: Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. ([Bug#19623](#))
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc 4.0`. ([Bug#19694](#))
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. ([Bug#4981](#))
- `mysql_upgrade` was missing from binary MySQL distributions. ([Bug#18516](#), [Bug#20403](#), [Bug#20556](#))
- It was possible using `ALTER EVENT ... RENAME ...` to move an event to a database on which the user did not have the `EVENT` privilege. ([Bug#18897](#))
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. ([Bug#20078](#))
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned `GOT ERROR 124 FROM STORAGE ENGINE` until `ALTER TABLE ... ENABLE KEYS` was run on the table. ([Bug#20357](#))
- A redundant table map event could be generated in the binary log when there were no actual changes to a table being replicated. In addition, a slave failed to stop when attempting to replicate a table that did not exist on the slave. ([Bug#18948](#))
- Multiple calls to a stored procedure that altered a partitioned `MyISAM` table would cause the server to crash. ([Bug#19309](#))
- Adding an index to a partitioned table that had been created using `AUTO_INCREMENT = value` caused the `AUTO_INCREMENT`

value to be reset. ([Bug#19281](#))

- A `CREATE TABLE` that produced a `THE PARTITION FUNCTION RETURNS THE WRONG TYPE` error also caused an `INCORRECT INFORMATION IN FILE` to be printed to `STDERR`, and a junk file to be left in the database directory. ([Bug#16000](#))
- Nested natural joins worked executed correctly when executed as a non-prepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. ([Bug#15355](#))
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. ([Bug#15962](#))
- The MD5() and SHA() functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. ([Bug#15351](#))
- For `BOOLEAN` mode full-text searches on non-indexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. ([Bug#14708](#))
- If the general log table reached a large enough file size (27GB), `SELECT COUNT(*)` on the table caused a server crash. ([Bug#17589](#))
- Identifiers could not contain bytes with a value of 255, though that should be allowed as of the identifier-encoding changes made in MySQL 5.1.6. ([Bug#12982](#))
- `BIT` columns in a table could cause joins that use the table to fail. ([Bug#18895](#))
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. ([Bug#18175](#))
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. ([Bug#19727](#))
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. ([Bug#19225](#))
- With settings of `read_buffer_size` $\geq$ 2G and `read_rnd_buffer_size` $\geq$ 2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. ([Bug#12982](#))
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. ([Bug#13479](#))
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. ([Bug#20195](#))
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `-add-drop-database` option and the database contained views. ([Bug#17201](#))
- Shutting down a slave in a replication scenario where temporary tables are in use would cause the slave to produce a core dump. ([Bug#19881](#))
- When a statement is executed that does not generate any rows, an extra table map event and associated binrows event would be generated and written to the binary log. ([Bug#19995](#))
- File size specifications for `InnoDB` data files were case sensitive. ([Bug#19609](#))
- Compilation on Windows would fail if row based replication was disabled using `--without-row-based-replication`. ([Bug#16837](#))
- `InnoDB` did not increment the `handler_read_prev` counter. ([Bug#19542](#))
- In the `INFORMATION_SCHEMA.FILES` table, the `INITIAL_SIZE`, `MAXIMUM_SIZE`, and `AUTOEXTEND_SIZE` columns incorrectly were being stored as `VARCHAR` rather than `BIGINT`. ([Bug#19544](#))
- For `mysqld`, Valgrind revealed problems that were corrected: Possible uninitialized data in a string comparison ([Bug#20783](#)); memory corruption in replication slaves when switching databases ([Bug#19022](#)); syscall write parameter pointing to uninitialized

byte ([Bug#20579](#)); uninitialized doublewrite memory in [InnoDB](#) ([Bug#20791](#)).

- For [ndb_mgmd](#), Valgrind revealed problems that were corrected: A memory leak ([Bug#19318](#)); a dependency on an uninitialized variable ([Bug#20333](#)).
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. ([Bug#18036](#))
- SSL connections using yaSSL on OpenBSD could fail. ([Bug#19191](#))
- Following a failed attempt to add an index to an [ARCHIVE](#) table, it was no longer possible to drop the database in which the table had been created. ([Bug#17310](#))
- Using `ALTER TABLE ... ENGINE = x`, where `x` was not a storage engine supported by the server, would cause `mysqld` to crash. ([Bug#20397](#))
- Defining a table partitioned by [LIST](#) with a single `PARTITION ... VALUES IN (NULL)` clause could lead to server crashes, particularly with queries having `WHERE` conditions comparing the partitioning key with a constant. ([Bug#19801](#) / [Bug#20268](#))
- Values greater than 2 gigabytes used in the `VALUES LESS THAN` clause of a table partitioned by `RANGE` were treated as negative numbers. ([Bug#16002](#))
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. ([Bug#20542](#))
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. ([Bug#20551](#))
- The `--default-storage-engine` server option did not work. ([Bug#20168](#))
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `yppbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). ([Bug#18810](#))
- For a reference to a non-existent index in `FORCE INDEX`, the error message referred to a column, not an index. ([Bug#17873](#))
- The `ENGINE` clause was displayed in the output of `SHOW CREATE TABLE` for partitioned tables when the SQL mode included `no_table_options`. ([Bug#19695](#))
- `ALTER TABLE ... COALESCE PARTITION` did not delete the files associated with the partitions that were removed. ([Bug#19305](#))
- `ALTER TABLE ... REBUILD PARTITION` could cause the server to hang or crash. ([Bug#19122](#))
- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. ([Bug#19575](#))
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. ([Bug#19604](#))
- If there is a global read lock, `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock. ([Bug#19815](#))
- `EXPLAIN PARTITIONS` would produce illegible output in the `partitions` column if the length of text to be displayed in that column was too long. This could occur when very many partitions were defined for the table, partitions were given very long names, or due to a combination of the two. ([Bug#19684](#))
- Trying to execute a query having a `WHERE` clause using `int_col = "string_value" OR int_col IS NULL` on a partitioned table whose partitioning or subpartitioning function used the integer column `int_col` would crash the server. ([Bug#19055](#))
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. ([Bug#20119](#))
- In MySQL 5.1.11, the `--with-openssl` and `--with-yassl` options were replaced by `--with-ssl`. But no message was issued if the old options were given. Now `configure` produces a message indicating that the new option should be used and exits. ([Bug#20002](#))

- Grant table modifications sometimes did not refresh the in-memory tables if the hostname was ' ' or not specified. (Bug#16297)
- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug#15328)
- Using `ALTER TABLE` on a subpartitioned table caused the server to crash. (Bug#19067)
- For a table having `LINEAR HASH` subpartitions, the `LINEAR` keyword did not appear in the `SUBPARTITION_METHOD` column of the `INFORMATION_SCHEMA.PARTITIONS` table. (Bug#20161)
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. (Bug#19391)
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
 - Change the default value of a column.
 - Change the table comment.
 - Change the table password.(Bug#17001)
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. (Bug#19192)
- The binary log lacked character set information for table name when dropping temporary tables. (Bug#14157)
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. (Bug#12873)
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. (Bug#18023)
- `OPTIMIZE TABLE` and `REPAIR TABLE` yielded incorrect messages or warnings when used on partitioned tables. (Bug#17455)
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. (Bug#18233)
- RPM packages had spurious dependencies on Perl modules and other programs. (Bug#13634)

C.1.19. Changes in release 5.1.11 (26 May 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible change:** The Event Scheduler can now be in one of three states (on, off, or the new suspended state). In addition, due to the fact that `SET GLOBAL event_scheduler;` now acts in a synchronous rather than asynchronous manner, the Event Scheduler thread can no longer be activated or deactivated at run time. (Bug#17619)

For more information regarding these changes, see [Section 21.1, “Event Scheduler Overview”](#).

- Previously, to build MySQL from source with SSL support enabled, you would invoke `configure` with either the `--with-openssl` or `--with-yassl` option. Those options both have been replaced by the `--with-ssl` option. By default, `--with-ssl` causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as `--with-ssl=path`, where `path` is the directory where the OpenSSL header files and libraries are located.
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the hostname used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default.

)

- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given via the corresponding command options. See [Section 5.8.7.3, “SSL Command Options”](#). ([Bug#19606](#))
- **NDB Cluster**: The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. ([Bug#14509](#))
- Added the `log_queries_not_using_indexes` system variable. ([Bug#19616](#))
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. ([Bug#14106](#))
- The `ENABLE KEYS` and `DISABLE KEYS` clauses for the `ALTER TABLE` statement are now supported for partitioned tables. ([Bug#19502](#))
- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. ([Bug#14635](#))
- The default for the `innodb_thread_concurrency` system variable was changed to 8. ([Bug#15868](#))
- `mysql_explain_log` (a third-party program) is no longer included in MySQL distributions.

Bugs fixed:

- **Security fix**: An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function. ([CVE-2006-2753](#), [Bug#8378](#))

This vulnerability was discovered and reported by Josh Berkus <josh@postgresql.org> and Tom Lane <tgl@sss.pgh.pa.us> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

Discussion: An SQL-injection security hole has been found in multi-byte encoding processing. An SQL-injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set unaware-escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

Workarounds: If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `-sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system).

- The patch for [Bug#8303](#) broke the fix for [Bug#8378](#) and was undone. (In string literals with an escape character (`\`) followed by a multi-byte character that has a second byte of (`\`), the literal was not interpreted correctly. The next byte now is escaped, not the entire multi-byte character. This means it a strict reverse of the `mysql_real_escape_string()` function.)

- The client libraries had not been compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. ([Bug#13159](#), [Bug#14202](#), [Bug#18091](#))
 - Altering a `VARCHAR` column in a `MyISAM` table to make it longer could cause corruption of the following column. ([Bug#19386](#))
 - A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. ([Bug#19089](#))
 - **NDB Cluster**: A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. ([Bug#14918](#))
 - **NDB Cluster**: `mysqld` processes did not always detect cluster shutdown, leading to issues with Cluster replication and schema distribution. ([Bug#19395](#))
 - **NDB Cluster**: `SELECT MIN(unique_column)` from a Cluster table with user-defined partitioning crashed the server. ([Bug#18730](#))
 - Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. ([Bug#19077](#))
 - For dates with 4-digit year parts less than 200, an implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) Now these operations return `NULL` rather than an incorrect non-`NULL` value. ([Bug#18997](#))
 - `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. ([Bug#18587](#))
 - Simultaneous scheduled events whose actions conflicted with one another could crash the server. ([Bug#16428](#))
 - It was not possible to invoke a stored routine containing dynamic SQL from a scheduled event. ([Bug#19264](#))
 - **NDB Cluster**: Running `ALL START` in the **NDB** management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. ([Bug#19930](#))
 - The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. ([Bug#13975](#))
 - `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. ([Bug#12472](#), [Bug#15137](#))
 - Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. ([Bug#6951](#))
 - The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. ([Bug#15869](#))
 - The embedded server crashed with row-based replication enabled. ([Bug#18518](#))
 - Display better error message for `ALTER TABLE` operations that will result in duplicate keys due to `AUTO_INCREMENT` resequencing. ([Bug#14573](#))
 - The `Data_free` column in the output of `SHOW TABLE STATUS` always displayed 0 for partitioned tables. ([Bug#19501](#))
 - Adding an index to a table created using partitioning by `KEY` and the `MEMORY` storage engine caused the server to crash. ([Bug#19140](#))
 - When creating a table using `CREATE TABLE ... PARTITION BY ... SELECT ...`, the partitioning clause was ignored. ([Bug#19062](#))
 - `ALTER TABLE ENGINE=...` failed when used to change a MySQL Cluster table having no explicit primary key to use a different storage engine. ([Bug#19010](#))
- Note:* As a consequence of this fix, `SHOW CREATE TABLE` no longer displays auto-partitioning information for **NDBCluster** tables.
- **NDB Cluster** (NDBAPI): On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. ([Bug#19537](#))

- **NDB Cluster**: Using “stale” `mysqld .FRM` files could cause a newly-restored cluster to fail. This situation could arise when re-starting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug#16875)
- **NDB Cluster** (Replication): Memory was not freed after some `ALTER TABLE` operations, which could cause `mysqld` processes to crash. (Bug#19885)
- **NDB Cluster** (NDBAPI): The `Ndb::dropEventOperation()` method failed to clean up all objects used, which could cause memory leaks to occur. (Bug#17610)
- **NDB Cluster**: Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug#13987)
- **NDB Cluster**: `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error `LOCK WAIT TIMEOUT EXCEEDED`. This affected both in-memory and Disk Data tables. (Bug#19201)
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. (Bug#17260)
- `EXPLAIN ... SELECT INTO` caused the client to hang. (Bug#15463)
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) (Bug#16803)
- The `basedir` and `tmpdir` system variables could not be accessed via `@@var_name` syntax. (Bug#1039)
- Corrected several problems with the treatment of the `--log-error` option by `mysqld_safe`. These problems were manifest as differences from `mysqld` in error log handling.
 - If a filename was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
 - `mysqld_safe` now adds `.err` to the end of the filename if no extension is present (the same as `mysqld`).
 - `mysqld_safe` treated a relative pathname as relative to its own current working directory. Now it treats a relative pathname as relative to the data directory (the same as `mysqld`).

In addition, some argument quoting problems were corrected. (Bug#6061)

- Returning the value of a system variable from a stored function caused a server crash. (Bug#18037)
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in bad entries in the binary log. (Bug#19136)
- `IS_USED_LOCK()` could return an incorrect connection identifier. (Bug#16501)
- Concurrent reading and writing of privilege structures could crash the server. (Bug#16372)

C.1.20. Changes in release 5.1.10 (Not released)

Note

This was an internal release only, and no binaries were published.

MySQL 5.1.10 includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting these to us.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Security enhancement**: Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count`

system variable. (Bug#16365)

- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).
- Binary distributions that include SSL support now are built using yaSSL when possible.
- The `MySQL-shared-compat-5.1.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0. This avoids a conflict because the 5.0 and 5.1 libraries share the same soname number. It contains libraries for 3.23, 4.0, 4.1, and 5.1. (Bug#19288)
- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. (Bug#18739)
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. (Bug#19308)
- XPath expressions passed to the `ExtractValue()` and `UpdateXML()` functions can now include the colon character (“ : ”). This enables use of these functions with XML which employs namespaces. (Bug#18170)
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. (Bug#17737)
- For the `mysql` client, typing Control-C causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. Previously, Control-C caused `mysql` to exit in all cases. (Bug#1989)
- Creating a table in an InnoDB database with a column name that matched the name of an internal InnoDB column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns error 1005 (cannot create table) with `errno` set to -1. (Bug#18934)
- On Windows, some names such as `nul`, `prn`, and `aux` could not be used as filenames because they are reserved as device names. These are now allowable names in MySQL. They are encoded by appending `@@@` to the name when the server creates the corresponding file or directory. This occurs on all platforms for portability of the corresponding database object between platforms. (Bug#17870)
- Added the `REFERENTIAL_CONSTRAINTS` table to `INFORMATION_SCHEMA`. It provides information about foreign keys.
- Added `--debug` option to Instance Manager.
- Added the `have_dynamic_loading` system variable that indicates whether the server supports dynamic loading of plugins.
- Added the `sql_big_selects` system variable to the output of `SHOW VARIABLES`.
- You must now have the `DROP` privilege to drop table partitions. (Bug#17139)
- **NDB Cluster**: It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without running `ndbd --initial` on all configured data nodes first. (Bug#18606)
- **NDB Cluster**: It is now possible to restore a Cluster backup between big-endian and little-endian machines. (Bug#19255)
- **NDB Cluster**: It is now possible to install MySQL with Cluster support to a non-default location and change the search path for font description files using either the `--basedir` or `--character-sets-dir` options. (Previously in MySQL 5.1, `ndbd` searched only the default path for character sets.)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) (Bug#13601)
- Added the `KEY_BLOCK_SIZE` table option and index option. This can be used in `CREATE TABLE`, `ALTER TABLE`, and `CREATE INDEX` statements to provide a hint to the storage engine about the size to use for index key blocks. The engine is allowed to change the value if necessary.

Bugs fixed:

- **Security fix**: A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized

memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (CVE-2006-1516, CVE-2006-1517) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug.

- **Security fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. (CVE-2006-1518) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug.
- **NDB Cluster** (Replication): Using the `--binlog-do-db` option caused problems with `CREATE TABLE` on the cluster acting as the replication master. (Bug#19492)
- **NDB Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug#17421)
- **NDB Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591)
- **NDB Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150)
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633)
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. (Bug#19573)
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. (Bug#20048)
- **MyISAM** table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug#16986)
- The patch for Bug#17164 introduced the problem that some outer joins were incorrectly converted to inner joins. (Bug#19816)
- A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (CVE-2006-0903) (Bug#17667)
- **NDB Cluster:** `mysqld` could crash when attempting an update if the cluster had failed previously. (Bug#18798)
- `mysql-test-run.pl` started **NDB** even for test cases that didn't need it. (Bug#19083)
- Selecting from a view that used `GROUP BY` on a non-constant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. (Bug#19490)
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. (Bug#19396)
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. (Bug#19564)
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug#17379, Bug#18940)
- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug#18068)
- Eliminated some memory corruption problems that resulted in `double free or corruption` errors and a server crash. (Bug#19154)
- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. (Bug#11081)
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug#14292)
- `MySQL-shared-compat-5.1.9-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. (Bug#16539)
- Updates to a **MEMORY** table caused the size of **BTREE** indexes for the table to increase. (Bug#18160)

- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x. (Bug#17810)
- The parser leaked memory when its stack needed to be extended. (Bug#18930)
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405)
- Use of `--default-storage-engine=innodb` resulted in an error with the server reporting that `InnoDB` was an unknown table type. (Bug#16691)
- Executing a `CREATE EVENT` statement could cause 100% CPU usage. (Bug#19170)
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug#15933)
- MySQL would not compile on Linux distributions that use the tinfo library. (Bug#18912)
- An issue with file handling in the partitioning code could cause `mysqld` to crash when started and then stopped within a very short period of time. (Bug#19313)
- **NDB Cluster** (Replication): When taking part in Cluster replication of tables containing `BLOB` columns, `mysqld` falsely reported a large memory leak in the replication buffers when there was none. (Bug#19247)
- **NDB Cluster**: Stopping multiple nodes could cause node failure handling not to be completed. (Bug#19039)
- **NDB Cluster**: A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug#18597)
- **NDB Cluster**: `ndbd` could sometimes fail to start with the error `NODE FAILURE HANDLING NOT COMPLETED` following a graceful restart. (Bug#18550)
- **NDB Cluster**: Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. (Bug#17607)
- **NDB Cluster**: A 5.1.6 or newer server did not read local checkpoints recorded by any other 5.1 version, thus preventing a system restart following an upgrade. (Bug#19333)
- **NDB Cluster**: Trying to restore the `apply_status` table from a 5.0 cluster backup failed on a 5.1 server. (Bug#18935)
- **NDB Cluster** (Disk Data): `CREATE LOGFILE GROUP` accepted values other than `NDB` or `NDBCLUSTER` in the `ENGINE` clause. (Bug#18604)
- **NDB Cluster** (Disk Data): Omitting the required `ENGINE` clause from a `CREATE LOGFILE GROUP` or `CREATE TABLESPACE` statement caused the server to crash. An appropriate error message is now returned instead. (Bug#18603)
- **NDB Cluster**: `mysqldump` included in its output data from the internal `cluster` database. (Bug#17840)
- Event-creation statements enclosed in multi-line comments using `/*!version_number ... */` syntax were not parsed correctly. (Bug#18078)
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. (Bug#16461)
- `mysqltest` incorrectly interpreted some `ER_XXX` error names given in the `error` command. (Bug#18495)
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug#18767)
- Logging to the `mysql.general_log` and `mysql.slow_log` tables did not work for Windows builds because the `CSV` storage engine was unavailable. The `CSV` engine now is enabled in Windows builds. (Bug#17368)
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. (Bug#18607)
- The binary log would create an incorrect `DROP` query when creating temporary tables during replication. (Bug#17263)
- `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` rule was enabled.

([Bug#18715](#))

- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. ([Bug#18312](#))
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. ([Bug#19145](#))
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of `myisam_block_size` (for example, with `key_cache_block_size=1536` and `myisam_block_size=1024`). ([Bug#19079](#))
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. ([Bug#17849](#))
- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). ([Bug#16195](#))
- `LAST_INSERT_ID()` in a stored function or trigger returned zero. . ([Bug#15728](#))
- Use of `CONVERT_TZ()` in a view definition could result in spurious syntax or access errors. ([Bug#15153](#))
- The `system_time_zone` and `version_*` system variables could not be accessed via `SELECT @@var_name` syntax. ([Bug#12792](#), [Bug#15684](#))
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. ([Bug#18691](#))
- Some fast `ALTER TABLE` operations (requiring no temporary table) did not work for all tables. ([Bug#19011](#))
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. ([Bug#15872](#))
- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. ([Bug#14308](#))
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. ([Bug#18544](#))
- A failed `ALTER TABLE` operation could fail to clean up a temporary `.frm` file. ([Bug#18129](#))
- For a reference to a non-existent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. ([Bug#18787](#))
- `InnoDB` did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. ([Bug#18350](#))
- `InnoDB` could read a delete mark from its system tables incorrectly. ([Bug#19217](#))
- `myisamchk` and `myisam_ftdump` should allow either table names or `.MYI` filenames as arguments, but allowed only table names. ([Bug#19220](#))
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. ([Bug#18344](#))
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. ([Bug#13621](#))
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. ([Bug#17917](#))
- `NDB Cluster` (NDBAPI): Passing a nonexistent index name to `NdbIndexScanOperation::setBound()` caused a segmentation fault. ([Bug#19088](#))
- `ALTER TABLE ... REBUILD PARTITION` returned an inaccurate error message. ([Bug#16819](#))
- `InnoDB`: A `DELETE` followed by an `INSERT` and then by an `UPDATE` on a partitioned `InnoDB` table caused subsequent queries to return incorrect results. ([Bug#17992](#))
- `NDB Cluster`: A table insert or update of more than 128 bytes of data in a 4-replica Cluster could cause a node to crash. ([Bug#18622](#))
- `NDB Cluster` (Disk Data): Concurrent table schema operations and operations on log files groups, tablespaces, data files, or un-

dofiles could lead to Cluster node failures. (Bug#18575)

- **NDB Cluster**: An issue with replication caused a `mysqld` connected to a replicated cluster to crash when entering single user mode. (Bug#18535)
- Successive `ALTER TABLE ... DROP PARTITION` statements on the same subpartitioned table could eventually cause the server to crash. (Bug#18962)
- **NDB Cluster**: When attempting to create an index on a `BIT` or `BLOB` column, `ERROR 743: UNSUPPORTED CHARACTER SET IN TABLE OR INDEX` was returned instead of `ERROR 906: UNSUPPORTED ATTRIBUTE TYPE IN INDEX`.
- **NDB Cluster**: The Cluster binlog `mysqld` accepted updates even though the binary log was not set up, which could lead to updates missing from the binary log. (Bug#18932)
- **NDB Cluster**: Concurrent `INSERT` and `ROLLBACK` statements from different connections could cause node failures. (Bug#19245)
- **NDB Cluster** (Disk Data): Running an `INSERT` and a `DELETE` on a Disk Data table in the same transaction could cause a deadlock. (Bug#19244)
- **NDB Cluster** (Disk Data): Issuing a `CREATE LOGFILE GROUP` statement during the drop of an `NDB` table would cause database corruption. (Bug#19141)
- **NDB Cluster**: `ndb_restore` failed to restore a backup made from a 5.0 cluster to a 5.1 cluster. (Bug#18210)
- **NDB Cluster**: Adding an index to an unsigned integer column did not work correctly. (Bug#18133)
- **NDB Cluster**: A `SELECT` from an `NDB` table with `ORDER BY indexed_column` and a `LIMIT` clause would fail following `ALTER TABLE`. (Bug#18094)
- **NDB Cluster**: Performing multiple `ALTER TABLE` operations on the same `NDB` table from different `mysqld` processes in the same cluster led to schema versioning errors when trying to access the table again following the restart of one of the `mysqld` processes. (Bug#16445)
- **NDB Cluster**: Starting `mysqld` without `--log-bin` caused DDL statements on `NDB` tables to time out. (Bug#19214)
- **NDB Cluster**: Fragment IDs were not being logged correctly, causing `ndb_restore_log` to fail. (Bug#18594)
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. (Bug#17043)
- **NDB Cluster** (Replication): Delete and update of rows in a table without a primary key failed on the slave. (Bug#17400)
- **NDB Cluster**: On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. (Bug#15530)
- The XPath `string-length()` function was not implemented for use with `ExtractValue()`. (Bug#16319)
- Fix the way that Instance Manager finds the version number of instances, so that it works properly when the executable name isn't the same as what the Instance Manager launched (such as when wrapping a `libtool`-wrapped executable from the source tree). (Bug#19059)
- The server attempted to flush uninitialized log tables during `SIGHUP` processing, causing a crash. (Bug#18848)
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01' - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. (Bug#18618)
- If the first argument to `BETWEEN` was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug#16069)
- `ExtractValue` function did not return character data within `<![CDATA[]]>` as expected. (Bug#18285)
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. (Bug#15069)
- It was possible to create a `RANGE`-partitioned table with a partition defined using the clause `VALUES LESS THAN (NULL)`, even though such a partition could never contain any values whatsoever. (Bug#18752)

- Running an `ALTER TABLE` on a partitioned table simultaneously experiencing a high number of concurrent DML statements could crash the server. (Bug#18572)
- It was possible to use trailing spaces in the names of partitions and subpartitions. Attempting to do so now raises the error `INCORRECT PARTITION NAME`. (Bug#17973)
- `LIKE` searches failed on a `CHAR` column used as the partitioning column of a table partitioned by `KEY`. (Bug#17946)
- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug#17164)
- The `ExtractValue()` function failed with a syntax error when the XPath expression used special characters such as `ñ` (“N-tilde”). (Bug#16233)
- Inserts failed with duplicate key errors on a table partitioned using an `AUTO_INCREMENT` column for the partitioning key. (Bug#18552, Bug#18753)
- Delimited identifiers for partitions were not being treated the same as delimited identifiers for other database objects (such as tables and columns) with regard to allowed characters. (Bug#18750)
- A query on a table partitioned or subpartitioned by `HASH` did not display all results when using a `WHERE` condition involving a column used in the hashing expression. (Bug#18423, Bug#18329)
- If the server were built without partition support, it was possible to run partitioning-related statements with no errors or warnings, even though these statements would have no effect. Now such statements are disallowed unless the server has been compiled using the `--with-partition` option. (Bug#15561)
- **NDB Cluster**: In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue). (Bug#16447)

A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug#18612)
- **NDB Cluster**: On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug#15695)
- **NDB Cluster**: Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from Cluster tables following an `ALTER TABLE`. (Bug#13228)
- **NDB Cluster**: Uninitialized internal variables could lead to unexpected results. (Bug#11033, Bug#11034)
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug#16504)
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug#18265)
- **InnoDB** failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug#15758)
- **InnoDB**: `ALTER TABLE` to add or drop a foreign key for an **InnoDB** table had no effect. (Bug#18477)
- **NDB Cluster**: Attempting to create an index using multiple columns on an explicitly partitioned table in a replicated Cluster database could cause the master `mysqld` process to crash. (Bug#18284)
- **NDB Cluster**: Queries using `ORDER BY pkN` failed against a `LIST`-partitioned Cluster table having a multi-column primary key, where `pkN` represents one of the columns making up the primary key. (Bug#18598)
- Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. (Bug#17284)

C.1.21. Changes in release 5.1.9 (12 April 2006)

This is a new Beta development release, fixing recently discovered bugs.

NOTE: This Beta release, as any other pre-production release, should not be installed on *production*-level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- `SHOW PLUGIN` was renamed to `SHOW PLUGINS`. `SHOW PLUGIN` now is deprecated and generates a warning. (Bug#17112)
- Binary MySQL distributions now include a `mysqld-max` server, in addition to the usual `mysqld` optimized server and the `mysqld-debug` debugging server.
- `mysqld_safe` no longer checks for a `mysqld-max` binary. Instead, `mysqld_safe` nows checks only for the standard `mysqld` server unless another server binary is specified explicitly via `--mysqld` or `--mysqld-version`. If you previously relied on the implicit invocation of `mysqld-max`, you should use an appropriate option now. (Bug#17861)
- For partitioned tables, the output of `SHOW TABLE STATUS` now shows in the `Engine` column the name of the storage engine used by all partitions for the table; in the `Create_options` column, the output now shows `partitioned` for a partitioned table. This change also affects the values shown in the corresponding columns of the `INFORMATION_SCHEMA.TABLES` table. (Bug#17631)
- **NDB Cluster:** A new `--nowait-nodes` startup option for `ndbd` makes it possible to “skip” specific nodes without waiting for them to start when starting the cluster. See [Section 16.6.5.2, “Command Options for ndbd”](#).
- The **NDBCluster** storage engine now supports `CREATE TABLE` statements of arbitrary length. (Previously, `CREATE TABLE` statements for MySQL Cluster tables could contain a maximum of 4096 characters only.) (Bug#17813)
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug#13571)
- The `mysql_get_ssl_cipher()` C API function was added.

Bugs fixed:

- **Security fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. (CVE-2006-3469, Bug#20729) Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it.
- **NDB Cluster:** `BLOB` columns did not work correctly with user-partitioned **NDB** tables. (Bug#16796)
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug#13158)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug#18830)
- `COUNT(*)` on a **MyISAM** table could return different results for the base table and a view on the base table. (Bug#18237)
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. (Bug#16240)
- For full-text searches in boolean mode, and when a full-text parser plugin was used, a `MYSQL_FTPARSER_PARAM::ftparser_state` could have been corrupted by recursive calls to the plugin. (Bug#18836)
- `EXTRACT(QUARTER FROM date)` returned unexpected results. (Bug#18100)
- `TRUNCATE` did not reset the `AUTO_INCREMENT` counter for **MyISAM** tables when issued inside a stored procedure. (Bug#14945)

■ Note

This bug did not affect **InnoDB** tables. Also, **TRUNCATE** does not reset the **AUTO_INCREMENT** counter for **NDB-Cluster** tables regardless of when it is called (see [Bug#18864](#)).

- The server was always built as though **--with-extra-charsets=complex** had been specified. ([Bug#12076](#))
- Partition pruning did not work properly for some kinds of partitioning and subpartitioning, with certain **WHERE** clauses. (Partitions and subpartitions that should have been marked as used were not so marked.) The error could manifest as incorrect content in **EXPLAIN PARTITIONS** output as well as missing rows in the results of affected queries. ([Bug#18558](#))
- **NDB Cluster**: An uninitialized internal variable could lead to unexpected results. ([Bug#18831](#))
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. ([Bug#16281](#))
- Complex queries with nested joins could cause a server crash. ([Bug#18279](#))
- A query against a partitioned table using **WHERE col IS NULL** could produce incorrect results given the following conditions:
 - The table had partitions and subpartitions
 - The partitioning function depended on a single column **col** of one of the MySQL integer types
 - The partitioning function was not monotonically increasing

The same issue could cause the server to crash when run in debug mode. ([Bug#18659](#))

- **CAST(double AS SIGNED INT)** for large **double** values outside the signed integer range truncates the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. ([Bug#15098](#))
- **MEDIUMINT** columns were not handled in the same way as other column types by partition pruning.

Partition pruning would sometimes use inappropriate columns in performing queries.

Both of these issues were rectified as part of the same bugfix. ([Bug#18025](#))

- Quoted values could not be used for partition option values. ([Bug#13520](#))
- Delimited identifiers could not be used in defining partitions. ([Bug#13433](#))
- Building the server using **--with-example-storage-engine** failed to enable the **EXAMPLE** storage engine in the server. ([Bug#18464](#))
- Triggers created in one version of the server could not be dropped after upgrading to a newer version. ([Bug#15921](#))
- Queries using **WHERE ... IS NULL** returned incorrect results from partitioned tables. ([Bug#18070](#))
- Partition pruning did not perform correctly with partitions on **NULL**, and could potentially crash the server. ([Bug#18053](#))
- If **InnoDB** encountered a **HA_ERR_LOCK_TABLE_FULL** error and rolled back a transaction, the transaction was still written to the binary log. ([Bug#18283](#))

C.1.22. Changes in release 5.1.8 (Not released)

Note

This was an internal release only, and no binaries were published.

Functionality added or changed:

- In order not to break legacy applications, support for **TYPE = engine_name** has been restored, but now generates a warning.

Important

This option has been deprecated since MySQL 4.0. Beginning with MySQL 5.2, `TYPE = engine_name` will no longer be available and will produce a syntax error. You should not use `TYPE` in any new applications, and you should immediately begin conversion of existing applications to use the `ENGINE = engine_name` syntax instead. (Bug#17501)

- The deprecated constructs in the following table now generate warnings. You should not employ them in new applications, as they are likely to be removed in a future version of MySQL. Use the equivalents shown in the table's second column instead. For the same reason, existing applications depending on the deprecated constructs should be converted to make use of the current equivalents as soon as possible. (Bug#17501)

Deprecated / Obsolete:	Current / Preferred:
<code>@@table_type</code>	<code>@@storage_engine</code>
<code>@@log_bin_trust_function_creators</code>	<code>@@log_bin_trust_function_creators</code>
<code>TIMESTAMP(N)</code>	See Section 11.6, “Date and Time Functions”.
<code>TYPE=</code>	<code>ENGINE=</code>
<code>BACKUP TABLE</code>	<code>mysql-dump</code> , <code>mysql-hotcopy</code> , or MySQL Administrator
<code>RESTORE TABLE</code> , <code>LOAD TABLE FROM MASTER</code>	<code>mysql-dump</code> , <code>mysql</code> , or MySQL Administrator
<code>SHOW TABLE TYPES</code>	<code>SHOW [STORAGE] ENGINES</code>
<code>SHOW INNODB STATUS</code>	<code>SHOW ENGINE INNODB STATUS</code>
<code>SHOW MU-TEXT STATUS</code>	<code>SHOW ENGINE INNODB MU-TEXT</code>
<code>SHOW BDB LOGS</code> , <code>SHOW LOGS</code>	<code>SHOW ENGINE BDB LOGS</code>

The deprecated items shown in the table are not guaranteed to be available in MySQL 5.2 or later.

- Incompatible change:** For purposes of determining placement, `RANGE` partitioning now treats `NULL` as less than any other value. (Formerly, `NULL` was treated as equal to zero.) See Section 17.2.6, “How MySQL Partitioning Handles `NULL` Values”. (Bug#15447)

- **Incompatible Change:** The semantics of `ALTER TABLE t ENGINE=X;` for partitioned tables is changed, and now means that the storage engine used for table *t* is changed to *X*.

The previous statement formerly (prior to MySQL 5.1.8) meant that all partitioning was removed from the table. In order to remove the partitioning of a table, the syntax `ALTER TABLE t REMOVE PARTITIONING;` is introduced. The `REMOVE PARTITIONING` option can be used in combination with existing `ALTER TABLE` options such as those employed for adding or dropping columns or indexes. (Bug#17754)

- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See [Section 11.6, “Date and Time Functions”](#). (Bug#15101)
- The `NDBCluster` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. (Bug#17431)
- Events no longer support times past the end of the Unix epoch. (Formerly, such dates were interpreted as being at the beginning of the Unix epoch.) (Bug#16396)
- Event names are now case-insensitive. That is (for example), you cannot have events with the names `Myevent` and `MyEvent` belonging to the same database and definer. (Bug#16415)
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. (Bug#18195)
- Temporary tables may no longer be partitioned. (Bug#17497)
- Added the `--events` option to `mysqldump` to enable events to be included in the dump output. (Bug#16853)
- **NDB Cluster (Disk Data):** You can now have only one log file group at any one time. See [Section 12.1.8, “CREATE LOGFILE GROUP Syntax”](#). (Bug#16386)
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See [Section 19.2.1, “CREATE PROCEDURE and CREATE FUNCTION Syntax”](#), for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

- The output from `SHOW CREATE TABLE` is more consistent about using uppercase for keywords. Data types still are in lowercase. (Bug#10460)
- The `ExtractValue()` function with `contains()` now uses the SQL collation in making comparisons. Previously, comparisons were always binary (that is, case-sensitive). (Bug#16316)
- The `cluster_replication` database has been renamed to `cluster`. This will effect replication between MySQL Clusters where one cluster is running MySQL 5.1.8 or later, and the other is running MySQL 5.1.7 or earlier. See [Section 16.10, “MySQL Cluster Replication”](#), and especially [Section 16.10.4, “Cluster Replication Schema and Tables”](#).
- The stability of `CREATE` and `DROP` operations on `NDB` tables containing `BLOB` columns has been improved. (Bug#17761)
- More specific error messages are now given when attempting to create an excessive number of partitions or subpartitions. (Previously, no distinction was made between an excessive number of partitions and an excessive number of subpartitions.) (Bug#17393)
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to allow test cases intended for Windows to work properly on UNIX-like systems. (Bug#13809)
- The `mysql_ping` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. (Bug#14057)
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. (Bug#14871)
- For an event having no `STARTS` time specified when it was created, the `mysql.event` table's `start` column now displays the creation time rather than `NULL`. (Bug#16537)

In addition, both the `SHOW EVENTS` statement's `Starts` column and the `STARTS` column of the `INFORMATION_SCHEMA.EVENTS` table are now empty rather than `NULL` when `STARTS` was not used in the `CREATE EVENT` statement.

- `MICROSECOND` intervals are no longer allowed for events. (Bug#16411)
- Description of the `EVENT` privilege has been changed to `To create, alter, drop, and execute events`. (Bug#16412)
- The `binlog_format` system variable now is dynamic and can be changed at runtime, as described in Section 15.1.2, “Replication Formats”.
- The `binlog_format` system variable now can be set to a third format, `MIXED`, as described in Section 15.1.2, “Replication Formats”.
- A slave server may switch the format *automatically* now. This happens when the server is running in either `STATEMENT` or `MIXED` format and encounters a row in the binary log that is written in `ROW` logging format. In that case, the slave switches to row-based replication temporarily for that event, and switches back to the previous format afterwards.
- Partition pruning was made more stable, particularly in cases involving queries using tests for `NULL` values in the `WHERE` clause against subpartitioned tables which were partitioned by `LIST( some_function(col1, ... ,colN) )`. (Bug#17891)
- Names of subpartitions must now be unique for an entire table, and not merely within the same partition. (Bug#15408)
- The output of `SHOW CREATE EVENT` no longer qualifies the event name with the name of the schem to which the event belongs. (Bug#17714)
- The client API will now attempt to reconnect on TCP/IP if the `reconnect` flag is set, as is the case with sockets. (Bug#2845)
- The XPath `last()` function is now implemented for use with `ExtractValue()`. (Bug#16318)

Bugs fixed:

- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. (Bug#17015)
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. (Bug#15375)
- Slave servers would retry the execution of a SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. (Bug#16228)
- Replication of data stored in a partitioned table would cause slave servers to issue a assertion and terminate. (Bug#18436)
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. (Bug#15846)
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. (Bug#17279)
- The server would crash when `SHOW STATUS` was called on a server linked with `yaSSL`. (Bug#18310)
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. (Bug#17374)
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. (Bug#16857)
- Execution of a stored function or trigger which inserted data into a table while running concurrent selects on the same table could result in storing incorrect data in the query cache. (Bug#14767)
- **NDB Cluster**: Attempting to restart a node with dropped events still pending would fail. (Bug#18491)
- **NDB Cluster**: In asynchronous replication scenarios, binary log events could be lost on the remote `mysqld`. (Bug#18472)

- **NDB Cluster**: Two `mysqld` processes starting at the same time could cause a race condition. (Bug#18472)
- **NDB Cluster**: Two `mysqld` processes did not synchronise `DROP TABLE` binary log events correctly. (Bug#18395)
- **NDB Cluster**: When multiple node restarts were attempted without allowing each restart to complete, the error message returned was `ARRAY INDEX OUT OF BOUNDS` rather than `TOO MANY CRASHED REPLICAS`. (Bug#18349)
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view might be `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1`. (Bug#18386)
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. (Bug#18153)
- **MyISAM**: Performing a bulk insert on a table referenced by a trigger would crash the table. (Bug#17764)
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server. (Bug#16474)

Note

The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `ith` column is deprecated (and non-standard). It should *not* be used in new applications. See [Section 12.2.7, “SELECT Syntax”](#).

- A `SELECT` using a function against a nested view would crash the server. (Bug#15683)
- `ALTER TABLE ... ADD COLUMN ... AFTER ...` failed when used on partitioned tables. (Bug#16806)
- **NDB Cluster**: A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. (Bug#18414)
- **NDB Cluster**: A node restart immediately following a `CREATE TABLE` would fail. **Important**: This fix supports 2-node Clusters only. (Bug#18385)
- **NDB Cluster**: In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug#18352)
- **NDB Cluster**: The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. (Bug#18298)
- **NDB Cluster**: When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug#18118)
- **NDB Cluster**: Restarting nodes were allowed to start and join the cluster too early. (Bug#16772)
- **NDB Cluster**: Issuing a `DROP LOGFILE GROUP` statement would cause `ndbd` processes to crash if MySQL had been compiled with `gcc4`. (Bug#18295)
- Using triggers with partitioned **InnoDB** tables led to incorrect results. (Bug#17744)
- Calling `CREATE TABLE` or `ALTER TABLE` twice on a partitioned table in a stored procedure or a prepared statement resulted in errors and sometimes server crashes. (Bug#17290)
- A problem with `NULL`s and interval mapping sometimes caused incorrect results or crashes when trying to use less-than searches on partitioned tables. (Bug#17173)
- `CREATE TABLE ... PARTITION ... AS SELECT ...` would cause the server to crash. (Bug#15336)
- Creating a partition which depends on an expression containing a column using the UTF8 character set would cause the server to crash. (Bug#14367)
- Invoking more than once a prepared statement that creates a partitioned table would crash the server. (Bug#14350)
- **NDB Cluster**: A `SELECT ... ORDER BY` query on an explicitly partitioned Cluster table with no explicit indexes would crash the server. (Bug#17899)
- The `ExtractValue()` function did not return an error when passed an invalid XPath string. (Bug#18172)

- Stored procedures that call UDFs and pass local string variables caused server crashes. ([Bug#17261](#))
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. ([Bug#18004](#))
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. ([Bug#11835](#))
- A security enhancement in Visual Studio 8 could cause a MySQL debug server compiled with it to hang when running `SELECT` queries against partitioned tables. ([Bug#17722](#))
- **NDB Cluster**: `auto_increment` values were not propagated correctly in statement-based replication. ([Bug#18208](#))
- Repeated invocations of a stored procedure containing a `SHOW CREATE EVENT` statement would result in the error `PACKETS OUT OF ORDER`. ([Bug#17403](#))
- Repeated invocations of a stored procedure containing a `CREATE EVENT` or `ALTER EVENT` statement would crash the server. ([Bug#16408](#))
- Renaming and adding a new column to a partitioned table in the same `ALTER TABLE` statement caused the server to crash. ([Bug#17772](#))
- `ALTER TABLE ... REBUILD PARTITION` with no partition name specified would crash the server. ([Bug#17940](#))
- Trying to add a partition to a table having subpartitions could crash the server. ([Bug#17140](#))
- Attempting to use a conflicting `VALUES` clause in `ALTER TABLE ... ADD PARTITION` caused the server to crash. An example of such a conflicting clause would be that uses `VALUES LESS THAN (constant)` (which indicates a range) with a table that is partitioned by `LIST`. ([Bug#17127](#))
- `ALTER TABLE ... COALESCE PARTITION` failed with an `OUT OF MEMORY` error. ([Bug#16810](#))
- Names of subpartitions were not displayed in the output of `SHOW CREATE TABLE`. ([Bug#16370](#))
- Setting up subpartitions on at least one but not all the partitions of a partitioned table caused the server to crash. ([Bug#15407](#))
- Using the `position()` function in the XPath argument to `ExtractValue()` crashed the server. ([Bug#18171](#))
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. ([Bug#17894](#))
- Cursors in stored routines could cause a server crash. ([Bug#16887](#))
- Replication slaves could not replicate triggers from older servers that included no `DEFINER` clause in the trigger definition. Now the trigger executes with the privileges of the invoker (which on the slave is the slave SQL thread). ([Bug#16266](#))
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. ([Bug#15949](#))
- `NULL` values were written to the `mysql.slow_log` table incorrectly. ([Bug#17600](#))
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. ([Bug#17894](#))
- A failed `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned table would result in bad table metadata and could possibly crash the server. ([Bug#17097](#))
- No error was reported when subpartitions were defined for a non-subpartitioned table. ([Bug#15961](#))
- Searches on indexed columns of partitioned tables failed to find all matching rows following updates of the indexed columns. ([Bug#14526](#))
- The `DEFINER` value for stored routines was not replicated. ([Bug#15963](#))
- Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. ([Bug#17137](#))
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. ([Bug#14980](#))

- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a WHERE clause of `salary > 100` then issuing an UPDATE statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. (Bug#17726)
- Creating a table with the same name as the mapped name of another table caused a server crash. For example, if MySQL maps the table name `txu#P#p1` to `txu@0023P@0023p1` on disk, creating another table named `txu@0023P@0023p1` crashed the server. (Bug#17142)
- **NDB Cluster**: Adding an index together with replication could cause `mysqld` to crash. (Bug#18106)
- **NDB Cluster**: Insufficient `StringBuffer` memory when attempting to create a trigger caused the server to crash. (Bug#18101)
- **NDB Cluster**: Variable-length columns used as primary keys were not handled correctly. (Bug#18075)
- **NDB Cluster**: Row-based replication could fail with tables using `VARCHAR` columns for primary keys and having `BLOB` columns. (Bug#18067)
- **NDB Cluster**: `CREATE UNIQUE INDEX` on a column containing non-unique data could cause one or more `ndbd` nodes to hang or crash. (Bug#18040)
- **NDB Cluster** (Disk Data): `CREATE UNIQUE INDEX` failed with `ERROR 4243: INDEX NOT FOUND`. (Bug#18039)
- **NDB Cluster**: Node recovery of tables with `VARCHAR` columns using character sets was inconsistent, which could cause a number of issues, including the data nodes failing to restart and `ALTER TABLE` statements to hang. (Bug#18026)
- **NDB Cluster**: In some cases, a single `ndbd` node would fail following a system restart. (Bug#17854)
- **NDB Cluster** (Replication): The binary log on the secondary master was not being set up correctly following a table rename. (Bug#17838)
- **NDB Cluster**: With a single replica, transactions waiting in the log synchronisation queue were not being restarted, causing them to be aborted. (Bug#17536)
- **NDB Cluster** (Disk Data): It was not possible to create more than 9 tablespaces. (Bug#16913)
- **NDB Cluster**: Inserting and deleting `BLOB` column values while a backup was in process could cause the loss of an `ndbd` node. (Bug#14028)
- **NDB Cluster**: `UNDO_BUFFER_SIZE` was limited to 17 MB. (Bug#16657, Bug#17890)
- Using `ALTER TABLE ... REBUILD PARTITION` without specifying the name of the partition caused the server to crash, rather than reporting a syntax error. (Bug#17947)
- When attempting to insert a `0` into a `LIST`-partitioned table that had no value-list containing `0`, no error was reported. (Bug#15253)
- If the server was started with the `--skip-grant-tables` option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. (Bug#16777)
- The server would execute stored routines that had a non-existent definer. (Bug#13198)
- **NDB Cluster**: A simultaneous `RENAME` of several tables was logged multiple times. (Bug#17827)
- **NDB Cluster**: Trying to perform a `DELETE` from a Cluster table following a `LOCK TABLES` would cause the `ndbd` processes to hang. (Bug#17812)
- `ALTER TABLE ... REORGANIZE PARTITION` failed with `ERROR ON RENAME OF FILENAME ...` on Windows. (Bug#17720)
- **NDB Cluster**: `ALTER TABLE ... ADD INDEX` failed with `ERROR 756: INDEX ON DISK COLUMN IS NOT SUPPORTED` when run against a Disk Data table having a primary key. (Bug#17888)
- **NDB Cluster**: `DELETE` operations on `NDB` tables could cause memory leaks. (Bug#16874)
- **NDB Cluster**: Some query cache statistics were not always correctly reported for Cluster tables. (Bug#16795)

- The `EXAMPLE` storage engine did not work on Windows. ([Bug#17721](#))
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. ([Bug#17377](#))
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large `MyISAM` tables. ([Bug#11527](#))
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. ([Bug#13134](#))
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. ([Bug#17602](#))
- `INSERT` statements executed by scheduled events were not written to the general log. ([Bug#16413](#))
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. ([Bug#16175](#))
- Naming a partition using the characters `Ç` or `ç` (“c-cedilla”; Unicode `00C7` or `00E7`) made unreadable the table containing the partition. ([Bug#14527](#))
- The `self()` XPath function was not handled correctly by `ExtractValue()`. ([Bug#16315](#))
- The `ExtractValue()` function would not accept expressions which matched element names containing an underscore character. ([Bug#16320](#))
- `NDB Cluster`: Trying to update very large partitioned tables using the `NDB` storage engine sometimes caused the server to crash. ([Bug#16385](#), [Bug#17806](#))
- Slow queries executed by scheduled events were not being written to the slow query log. ([Bug#16426](#))
- On Linux, creation of table partitions failed within a stored procedure. ([Bug#14363](#))
- `mysql_fix_privilege_tables` didn't create the `mysql.plugin` table. ([Bug#17568](#))
- Improper checking of binary log statements could result in a server crash. ([Bug#17457](#))
- The `ExtractValue()` function allowed the use of the `!` character in identifiers by ignoring the illegal character. This is now correctly reported as a syntax error. ([Bug#16313](#))
- `NDB Cluster`: Trying to insert a value into a nonexistent `LIST` partition of an `NDB` table would cause the server to crash. ([Bug#17763](#))
- `NDB Cluster`: `ALTER TABLE` on a partitioned `NDB` table could cause the server to crash. ([Bug#17499](#))
- `NDB Cluster`: A repeated `SELECT` on a partitioned table that used the `NDB` storage engine could cause the server to crash. ([Bug#17390](#))
- `NDB Cluster`: Using `ALTER TABLE ... ADD PARTITION` on a table partitioned by `LIST` would cause the client to hang. ([Bug#17701](#))
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and re-playing a binary log. ([Bug#16878](#))
- The `RENAME TABLE` statement did not move triggers to the new table. ([Bug#13525](#))
- Clients compiled from source with the `--without-readline` did not save command history from session to session. ([Bug#16557](#))
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. ([Bug#14857](#))
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. ([Bug#7787](#))
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. ([Bug#17169](#))
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions

or activated triggers coincident with alteration of the tables used by these functions or triggers. ([Bug#16593](#))

C.1.23. Changes in release 5.1.7 (27 February 2006)

Functionality added or changed:

- **Incompatible change:** `TYPE = engine_name` is no longer accepted as a synonym for the `ENGINE = engine_name` table option. (`TYPE` has been deprecated since MySQL 4.0.)
- Several changes were made to make upgrades easier:
 - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See [Section 5.5.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).
 - Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
 - Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option. Added the `--fix-db-names` and `--fix-table-names` options to `mysqlcheck`.
- **Incompatible change:** The `mysql_stmt_attr_get()` C API function now returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. ([Bug#16144](#))
- Added the `--wait-timeout` option to `mysqlmanager` to allow configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). ([Bug#12674](#), [Bug#15980](#))
- All subpartitions within a given partitioned table are now guaranteed to have unique names. ([Bug#15408](#))
- Added the `RENAME DATABASE` statement.
- The SQL mode in effect at the time an event is created or altered is recorded and used during event execution. ([Bug#16407](#))
- Added the `PROCESSLIST` table to `INFORMATION_SCHEMA`.
- Attempting to read pre-5.1.6 partitioned tables with a MySQL 5.1.7 (or later) server now generates a suitable warning message. ([Bug#16695](#))

For additional information about this issue, see [Section C.1.24, “Changes in release 5.1.6 \(01 February 2006\)”](#).
- **NDB Cluster:** Attempting to `SELECT ... FROM INFORMATION_SCHEMA.FILES` now raises a warning in the event that the cluster has crashed. ([Bug#17087](#))
- **NDB Cluster:** It is now possible to replicate NDB tables having no explicit primary key. See [Section 16.10, “MySQL Cluster Replication”](#).
- Removed the `have_isam` and `have_raid` system variables.
- Status messages added to `ndb_restore` to allow users to know that data files for Disk Data are being created. ([Bug#16873](#))
- Added the `IN NATURAL LANGUAGE MODE` and `IN NATURAL LANGUAGE MODE WITH QUERY EXPANSION` modifiers for full-text searches. See [Section 11.8, “Full-Text Search Functions”](#).
- Creator privileges are now checked for all events before execution. ([Bug#17289](#))
- `CREATE EVENT`, `DROP EVENT`, and `ALTER EVENT` statements are not allowed in triggers. ([Bug#16410](#))
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. ([Bug#16217](#))
- In row-based replication, when executing a `Rows_log_event`, the associated table was locked, the rows applied and the lock released. This did not work since there are storage engines that count locks and perform an autocommit when the number of locks reach zero. Now we ensure that all table maps come before all `ROWS` events in a statement.

Bugs fixed:

- **NDB Cluster**: `ndbd` restart could sometimes fail due to incorrect memory access. ([Bug#17417](#))
- Execution times for scheduled events were not calculated correctly: the last execution time was used as a base rather than the actual start time. ([Bug#17494](#))
- Using an XPath expression containing `=` with `ExtractValue()` caused the server to crash. ([Bug#16242](#))
- **NDB Cluster**: An unhandled resources issue could cause node failure with a `DELETE FROM TABLE` affecting thousands of rows. ([Bug#16492](#))
- **NDB Cluster**: Cluster tables not having an explicit primary key could not be replicated. ([Bug#14541](#))
- For a transaction that used **MyISAM** and **InnoDB** tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. ([Bug#16559](#))
- `SELECT` with `GROUP BY` on a view could cause a server crash. ([Bug#16382](#))
- `SET TRANSACTION ISOLATION LEVEL` acted like `SET SESSION TRANSACTION ISOLATION LEVEL`. That is, it set the isolation level for longer than the next transaction. ([Bug#7955](#))
- `SHOW CREATE TABLE` produced extraneous spaces after the `PRIMARY KEY` keywords. ([Bug#13883](#))
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. ([Bug#16603](#))
- `SUBSTRING_INDEX()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. ([Bug#14676](#))
- `myisam_ftdump` did not work for `FULLTEXT` indexes associated with a parser plugin. ([Bug#17116](#))
- `BIT` fields were not properly handled when using row-based replication. ([Bug#13418](#))
- Column counts were encoded incorrectly in the binary log for row-based logging format. ([Bug#17678](#))
- Data truncations on non-`UNIQUE` indexes could crash **InnoDB** when using multi-byte character sets. ([Bug#17530](#))
- An `ALTER DATABASE` statement on a replication master crashed the slaves. ([Bug#17521](#))
- Partitioning with certain `SUBPARTITION BY HASH` clauses caused an error when querying for a partitioned column using an `IS NULL` comparison. ([Bug#17430](#), [Bug#17432](#))
- The `mysql_fix_privilege_tables.sql` script did not properly initialize the `Event_priv` column to 'Y' for those accounts that should have the `EVENT` privilege. ([Bug#16400](#))
- **NDB Cluster**: Inserting the output of `REPEAT('some_string', some_int)` into a `BLOB` column resulted in the error `INVALID BLOB ATTRIBUTES OR INVALID BLOB PARTS TABLE`. ([Bug#17505](#))
- **NDB Cluster**: Row-based replication was not being set up correctly if a backup was already in progress. For example, connecting a `mysqld` instance to a cluster which was being backed up would result in the message `NDB: SKIPPING SETUP TABLE TEST.T1` being written to the error log. ([Bug#17459](#))
- **NDB Cluster**: `CREATE TEMPORARY TABLE` of a Cluster table would fail with an `UNSUPPORTED` error or crash the server. ([Bug#17210](#), [Bug#16552](#))
- **NDB Cluster**: `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. ([Bug#15918](#))
- **NDB Cluster**: `REPLACE` failed when attempting to update a primary key value in a Cluster table. ([Bug#14007](#))
- **NDB Cluster**: Creating **NDB** tables containing `BLOB` columns but no primary key caused unpredictable behavior. ([Bug#17559](#))
- Creating an event and using a whitespace character other than space following the `DO` keyword caused a server crash. ([Bug#17453](#))
- Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and oc-

curs within a non-logged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). (Bug#14769)

- `CHECKSUM TABLE` returned different values on MyISAM table depending on whether the `QUICK` or `EXTENDED` options were used. (Bug#8841)
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table on a non-max server caused a server crash. This also happened following the creation of a table with a very large number (hundreds) of partitions. (Bug#16591, Bug#17141)
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. (Bug#17169)
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. (Bug#16260)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug#14927)
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. (Bug#16203)
- `DROP DATABASE` did not drop events for the database. (Bug#16406)
- Race conditions between event creation, dropping, and execution could result in a server crash or hang. (Bug#17373)
- `SET sql_mode = N`, where $N > 31$, did not work properly. (Bug#13897)
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. (Bug#6536)
- When used with the `ExtractValue()` function, an XPath expression having no leading “/” character would crash the server. (Bug#16234)
- A `SELECT` from the last partition of a subpartitioned table having a `UNIQUE KEY` could crash the MySQL Server. (Bug#16907)
- A `SELECT` on a subpartitioned table having a multiple-column `PRIMARY` or `UNIQUE KEY`, and whose partitioning function used only the first column of the key, could cause `mysqld` to crash. (Bug#16901)
- Using `REPLACE INTO` on a partitioned table having a primary key would crash the server in the event of a duplicate key error. (Bug#16782)
- `DROP TABLE` would sometimes fail on a table having subpartitions that used the default storage engine. (Bug#16775)
- **NDB Cluster**: Sharing of table names containing special characters between multiple SQL nodes was not handled correctly when binary logging was enabled (a timeout error resulted). (Bug#17415)
- **NDB Cluster**: Table definitions were not shared between multiple SQL nodes in a cluster without binary logging being enabled. (Bug#17414)
- **NDB Cluster**: Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). (Bug#17411)
- `SHOW CREATE EVENT` displayed no output. (Bug#16423)
- Statements that contained Unicode characters were not logged to the log tables correctly. (Bug#16905)
- On Windows platforms, some attempts to create partitioned tables from the command line would cause the `mysql` client to hang. (Bug#17082)
- **NDB Cluster**: `SHOW CREATE TABLE` would fail when run against a table created in a different session. (Bug#17340)
- **NDB Cluster**: Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. (Bug#17325)
- **NDB Cluster**: An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. (Bug#17257)
- **NDB Cluster**: A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. (Bug#17249)

- The **NDB Cluster** storage engine did not allow views to be updated. (Bug#17206)
- **NDB Cluster**: Row-based replication of a cluster failed to take `--binlog_ignore_db` settings into account. (Bug#17188)
- Trying to create a partitioned table with more than 32 attributes failed. (Bug#17179)
- **NDB Cluster**: When attempting to import data into an **NDB** table using `LOAD DATA INFILE`, the server would hang in the event of a duplicate key error. (Bug#17154)
- **NDB Cluster**: In some cases, `LOAD DATA INFILE` did not load all data into **NDB** tables. (Bug#17081)
- **NDB Cluster**: Performing large numbers of data manipulation statements on cluster tables using Disk Data could lead to a server crash. ()
- **NDB Cluster**: In some cases, a cluster using Disk Data tables could not be restarted following a normal shutdown. (Bug#16872)
- **NDB Cluster**: The **REDO** log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. (Bug#17295)
- **NDB Cluster**: `CREATE TABLE new_tbl LIKE old_tbl;` failed when `old_tbl` used the **NDB** storage engine. (Bug#17005)
- **NDB Cluster**: No error message was generated for setting `NoOfFragmentLogFiles` too low. (Bug#13966)
- **NDB Cluster**: No error message was generated for setting `MaxNoOfAttributes` too low. (Bug#13965)
- The **SELECT** privilege was required for triggers that performed no selects. (Bug#15196)
- The **UPDATE** privilege was required for triggers that performed no updates. (Bug#15166)
- `CAST( ... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. (Bug#15805)
- Killing a long-running query containing a subquery could cause a server crash. (Bug#14851)
- **InnoDB** could display an incorrect error message for a cascading update. (Bug#9680)
- A **RETURN** statement within a trigger caused a server crash. **RETURN** now is disallowed within triggers. To exit immediately, use **LEAVE**. (Bug#16829)

C.1.24. Changes in release 5.1.6 (01 February 2006)

Functionality added or changed:

- **Packaging changes**: MySQL 5.1.6 introduces some changes to distribution packaging:
 - Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
 - There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
 - Server binaries no longer are stripped, except for RPM distributions.
 - Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- **Incompatible change**: This release introduces the **TRIGGER** privilege. Previously, the **SUPER** privilege was needed to create or drop triggers. Now those operations require the **TRIGGER** privilege. This is a security improvement because you no longer need to grant users the **SUPER** privilege to enable them to create triggers. However, the requirement that the account named in a trigger's **DEFINER** clause must have the **SUPER** privilege has changed to a requirement for the **TRIGGER** privilege. After upgrading, be sure to update your grant tables as described in [Section 5.5.3, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#). This process assigns the **TRIGGER** privilege to all accounts that had the **SUPER** privilege. (After updating, you might also

consider whether any of those accounts no longer need [SUPER](#).) If you fail to update the grant tables, triggers may fail when activated. ([Bug#9142](#))

- **Incompatible change:** Before MySQL 5.1.6, the server writes general query log and slow query log entries to log files. As of MySQL 5.1.6, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the [general_log](#) and [slow_log](#) tables in the [mysql](#) database. If logging is enabled, either or both destinations can be selected. The [--log-output](#) option controls the destination or destinations of log output. See [Section 5.11.1, “Selecting General Query and Slow Query Log Output Destinations”](#).

If logging is enabled, the default destination now is to log to tables, which differs from earlier versions. If you had the server configured for logging to log files formerly, use [--log-output=FILE](#) to preserve this behavior after an upgrade to MySQL 5.1.6 or higher.

- **Incompatible change:** Due to a change in the naming scheme for partitioning and subpartitioning files, it is not possible for the server to read partitioned tables created in previous MySQL versions. A suggested workaround is (1) to create a non-partitioned table with the same table schema using a standard [CREATE TABLE](#) statement (that is, with no partitioning clauses) and then (2) to issue a [SELECT INTO](#) to copy the data into the non-partitioned table before the upgrade; following the upgrade, you can partition the new table using [ALTER TABLE ... PARTITION BY ...](#). Alternatively, you can dump the table using [mysqldump](#) prior to upgrading and reload it afterwards with [LOAD DATA](#). In either case, you should drop the pre-5.1.6 partitioned tables before upgrading to 5.1.6 or later. ([Bug#13437](#))

Important

If any partitioned tables that were created prior to MySQL 5.1.6 are present following an upgrade to MySQL 5.1.6 or later, it is also not possible to read from the [INFORMATION_SCHEMA.PARTITIONS](#) table, nor will you be able to drop those tables or the database or databases in which they are located. In this event, you must: (1) shut down [mysqld](#); (2) manually delete the table, partition, and (if any) subpartition files; and then (3) restart the MySQL Server. ([Bug#16695](#))

- **Incompatible change:** Words with apostrophes are now matched in a [FULLTEXT](#) search against non-apostrophe words (for example, a search for [Jerry](#) will match against the term [Jerry's](#)). Users upgrading to this version must issue [REPAIR TABLE](#) statements for tables containing [FULLTEXT](#) indexes. ([Bug#14194](#))
- MySQL 5.1.6 introduces the *Event Scheduler* which allows one to schedule statements for execution at predetermined times. Events can be transient (one-time-only) or recurrent at regular intervals, and may execute queries and statements permitted in stored routines, including compound statements.

Events can be altered after creation, and dropped when no longer needed.

Information about scheduled events can be obtained using the statements [SHOW EVENTS](#) and [SHOW CREATE EVENT](#), or by querying the [INFORMATION_SCHEMA.EVENTS](#) table. All of these are available beginning in MySQL 5.1.6.

Users must have the [EVENT](#) privilege (also added in 5.1.6) to create events.

For more information, see [Chapter 21, Event Scheduler](#).

- Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a non-cluster database. See [Section 16.10, “MySQL Cluster Replication”](#).
- Special characters in database and table identifiers now are encoded when creating the corresponding directory names and filenames. This relaxes the restrictions on the characters that can appear in identifiers. See [Section 8.2.3, “Mapping of Identifiers to Filenames”](#).
- Queries against partitioned tables can now take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a non-partitioned version of the same table.
- The [mysqldump](#) utility now supports an option for dumping tablespaces. Use [-Y](#) or [--all-tablespaces](#) to enable this functionality. ([Bug#16753](#))
- Partition support is not an “engine”, but it was included in the output of [SHOW ENGINES](#). Now it is not. ([Bug#14355](#)) The [have_partition_engine](#) variable was renamed to [have_partitioning](#). ([Bug#16718](#))
- [ANALYZE TABLE](#) is now supported for partitioned tables. ([Bug#13441](#))
- Added the [event_scheduler](#) system variable.
- Added the [ndb_extra_logging](#) system variable.

- Added the `FILES` table to `INFORMATION_SCHEMA`.
- Added the `EVENTS` table to `INFORMATION_SCHEMA`.
- Added the `PARTITIONS` table to `INFORMATION_SCHEMA`.
- The `ARCHIVE` storage engine now supports the `AUTO_INCREMENT` column attribute and the `AUTO_INCREMENT` table option. [Section 13.10, “The ARCHIVE Storage Engine”](#).
- Added support for the `CREATE INDEX` and `DROP INDEX` statements to the `NDB Cluster` storage engine.
- Server plugins can register their own status variables to be displayed by the `SHOW STATUS` statement.

Bugs fixed:

- An indexing error sometimes caused values to be assigned to the wrong `RANGE` partition. ([Bug#16684](#))
- `NDB Cluster`: `ndb_delete_all` would run out of memory on tables containing `BLOB` columns. ([Bug#16693](#))
- Using the `TRUNCATE()` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. ([Bug#8461](#))
- When the fulltext search parser plugin returned more words than half of the length (in bytes) of the query string, the server would crash. ([Bug#16722](#))
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. ([Bug#15588](#))
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. ([Bug#14496](#))
- `STR_TO_DATE(1, NULL)` caused a server crash. ([CVE-2006-3081](#), [Bug#15828](#))
- An `INSERT` statement in a stored procedure corrupted the binary log. ([Bug#16621](#))
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. ([Bug#15719](#))
- Specifying a value for `--tmpdir` without a trailing slash had unpredictable results. ([Bug#15904](#))
- Attempting to insert data into a partitioned table that used the `BLACKHOLE` storage engine caused `mysqld` to crash. ([Bug#14524](#))
- Using `RANGE` partitioning with a `CASE` statement as the partitioning function would cause records to be placed in the wrong partition. ([Bug#15393](#))
- `ALTER TABLE ... ADD PARTITIONS` on a table with one partition crashed the server. ([Bug#15820](#))
- `NDB Cluster` returned incorrect `Can't find file` error for OS error 24, changed to `Too many open files`. ([Bug#15020](#))
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to filenames. ([Bug#12448](#))
- Certain subqueries where the inner query is the result of an aggregate function would return different results on MySQL 5.0 than on MySQL 4.1. ([Bug#15347](#))
- The error message for specifying values for which no partition exists returned wrong values on certain platforms. ([Bug#15910](#))
- Certain Japanese table names were not properly saved during a `CREATE TABLE` statement. ([Bug#3906](#))
- `NDB Cluster` leaked disk space when performing `INSERTS/DELETES` in a loop. ([Bug#16771](#))
- `NDB Cluster` returned wrong error when tablespace on disk was full. ([Bug#16738](#))
- The `DATA DIRECTORY` and `INDEX DIRECTORY` clauses of a `CREATE TABLE` statement involving partitions did not work. ([Bug#14354](#))
- Subselect could return wrong results when records cache and grouping was involved. ([Bug#15347](#))

- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. (Bug#15633)
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. (Bug#15538)
- **NDB Cluster**: Trying to import too many dumped tables requiring resources beyond those allocated in the cluster configuration would cause the server to crash instead of reporting an insufficient resources error. (Bug#16455)
- **NDB Cluster** (Disk Data): Tablespaces created using parameters with relatively low values (< 10 MB) produced filesizes much smaller than expected. (Bug#16742)
- **NDB Cluster**: **CREATE TABLESPACE** statements were incorrectly parsed on 64-bit platforms. (**INITIAL SIZE size** worked, but **INITIAL SIZE = size** failed.) (Bug#13556)
- Trying to add more than one partition in a single **ALTER TABLE ... ADD PARTITION** statement caused the server to crash. (Bug#16534)
- Creating a partitioned table using a storage engine other than the session default storage engine caused the server to crash. (Bug#15966)
- An **ALTER TABLE ... PARTITION BY ...** statement did not have any effect. (Bug#15523)
- **NDBCluster** (Disk Data): The error message generated by a failed **ADD UNDOFILE** did not provide any reasons for the failure. (Bug#16267)
- **NDBCluster** (Disk Data): **DROP LOGFILE GROUP** corrupted the cluster file system and caused **ndbd** to fail when running more than one node on the same system. (Bug#16193)
- **NDBCluster**: A bitfield whose offset and length totaled 32 would crash the cluster. (Bug#16125)
- **NDBCluster**: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incompleted error handling of the failed node. (Bug#15908)
- **NDBCluster**: The **ndb_autodiscover** test failed sporadically due to a node not being permitted to connect to the cluster. (Bug#15619)
- Using **mysqldump** to obtain a dump of a partitioned table employing the **NDB** storage engine produced a non-functional table creation statement. (Bug#13155)
- **SHOW CREATE TABLE** did not display the **PARTITIONS** clause for tables partitioned by **HASH** or **KEY**. (Bug#14327)
- Inserting a negative value into an integer column used as the partitioning key for a table partitioned by **HASH** could cause the server to crash. (Bug#15968)
- With a table partitioned by **LIST**, inserting a value which was smaller than any value shown in the partitioning value-lists could cause the server to crash. (Bug#14365)
- **ALTER TABLE ... DROP PARTITION** would truncate all **DATE** column values in the table's remaining partitions to **NULL**. (Bug#13644)
- **ALTER TABLE ... ADD PARTITION** could crash the server or cause an **OUT OF MEMORY** error in some circumstances. (Bug#13447)
- The server would allow foreign keys to be declared in the definition of a partitioned table despite the fact that partitioned tables do not support foreign keys (see [Section 17.5, “Restrictions and Limitations on Partitioning”](#)). (Bug#13446)
- A **SELECT** from a key-partitioned table with a multi-column key could cause the server to crash. (Bug#13445)
- Issuing a **TRUNCATE** statement twice in succession on the same partitioned table would cause the server to crash. (Bug#13442)
- Using a **REPLACE** statement on a partitioned table caused the server to crash. (Bug#13440)
- Using an identifier rather than a literal integer value in the **LESS THAN** clause of a range-partitioned table could cause the server to crash and corruption of tables. (Bug#13439)

- Using `ENGINE=...` within a `PARTITION` clause could cause the server to crash. ([Bug#13438](#))
- `CREATE TABLE ... LIKE` did not work if the table whose schema was to be copied was a partitioned table. ([Bug#13435](#))
- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. ([Bug#14327](#))
- Certain permission management statements could create a `NULL` hostname for a user, resulting in a server crash. ([Bug#15598](#))
- Temporary table aliasing did not work inside stored functions. ([Bug#12198](#))
- Parallel builds occasionally failed on Solaris. ([Bug#16282](#))

C.1.25. Changes in release 5.1.5 (10 January 2006)

Functionality added or changed:

- Added the `INFORMATION_SCHEMA ENGINES` table.
- Added the `INFORMATION_SCHEMA PLUGINS` table and the `SHOW PLUGIN` statement.
- Added the `binlog_format` system variable that controls whether to use row-based or statement-based binary logging. Added the `--binlog-format` and `--binlog-row-event-max-size` server options for binary logging control. See [Section 15.1.2](#), “Replication Formats”.
- Plugins now can have status variables that are displayed in the output from `SHOW STATUS`. See [Section 28.2.5](#), “Writing Plugins”.
- Added the XML functions `ExtractValue()` and `UpdateXML()`. `ExtractValue()` returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See [Section 11.10](#), “XML Functions”.
- Added the `--base64-output` option to `mysqlbinlog` to print all binary log entries using base64 encoding. This is for debug-only. Logs produced using this option should not be applied on production systems.
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. ([Bug#15591](#))
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; this issue will be fixed in a future release.

Bugs fixed:

- **InnoDB**: An `UPDATE` statement with no index column in the `WHERE` condition locked all the rows in the table. ([Bug#3300](#))
- `INSERT DELAYED` caused `mysqld` to crash. ([Bug#16095](#))
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. ([Bug#15110](#))
- The output of `SHOW TRIGGERS` contained extraneous whitespace. ([Bug#15103](#))
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](#))
- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. ([Bug#14212](#))
- **InnoDB**: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. ([Bug#14583](#))
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. ([Bug#14863](#))

- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. (Bug#15775)
- The `--plugin_dir` option was not working. Also fix error with specifying parser name for fulltext. (Bug#16068)
- Attempting to insert into a table partitioned by `LIST` a value less than any specified in one of the table's partition definitions resulted in a server crash. In such cases, `mysqld` now returns `ERROR 1500 (HY000): TABLE HAS NO PARTITION FOR VALUE v`, where `v` is the out-of-range value. (Bug#15819)

C.1.26. Changes in release 5.1.4 (21 December 2005)

Functionality added or changed:

- Added the `mysqlslap` program, which is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server.
- Added the `--server-id` option to `mysqlbinlog` to enable only those events created by the server having the given server ID to be extracted. (Bug#15485)
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where `N#128` is the maximum number of indexes to permit per table. (Bug#10932)
- The bundled `BDB` library was upgraded to version 4.4.16.
- Added the `cp1250_polish_ci` collation for the `cp1250` character set.
- Added the `myisam_use_mmap` system variable.
- Added the `--bdb-data-direct` and `--bdb-log-direct` server options.

Bugs fixed:

- `SHOW ENGINES` output showed the `FEDERATED` engine as `DISABLED` even for builds with `FEDERATED` support. (Bug#15559)
- Server could not be built on default Debian systems with `BDB` enabled. (Bug#15734)
- `BDB`: A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. (Bug#15536)
- A left join on a column that having a `NULL` value could cause the server to crash. (Bug#15268)
- It was not possible to reorganize a partition reusing a discarded partition name.

Now, for example, you can create a table such as this one:

```
CREATE TABLE t1 (a INT)
PARTITION BY RANGE (a) (
  PARTITION p0 VALUES LESS THAN (10),
  PARTITION p1 VALUES LESS THAN (20),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

and then repartition it as shown here:

```
ALTER TABLE t1 REORGANIZE PARTITION p2 INTO (
  PARTITION p2 VALUES LESS THAN (30)
);
```

Previously, attempting to do so would produce the error `ALL PARTITIONS MUST HAVE UNIQUE NAMES IN THE TABLE`. (Bug#15521)

- `NDB Cluster`: The `--ndb` option for `percona` did not function. (Bug#15486)

- The **BLACKHOLE** storage engine did not handle transactions properly: Rolled-back transactions were written to the binary log. Now they are not. ([Bug#15406](#))
- **NDB Cluster**: Using **ORDER BY primary_key_column** when selecting from a table having the primary key on a **VARCHAR** column caused a forced shutdown of the cluster. ([Bug#14828](#), [Bug#15240](#), [Bug#15682](#), [Bug#15517](#))
- **ANALYZE TABLE** did not properly update table statistics for a **MyISAM** table with a **FULLTEXT** index containing stopwords, so a subsequent **ANALYZE TABLE** would not recognize the table as having already been analyzed. ([Bug#14902](#))
- The maximum value of **MAX_ROWS** was handled incorrectly on 64-bit systems. ([Bug#14155](#))
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. ([Bug#15028](#))
- **SELECT** queries that began with an opening parenthesis were not being placed in the query cache. ([Bug#14652](#))
- Space truncation was being ignored when inserting into **BINARY** or **VARBINARY** columns. Now space truncation results in a warning, or an error in strict mode. ([Bug#14299](#))
- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. ([Bug#15119](#))
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. ([Bug#15096](#))
- Creating a view within a stored procedure could result in an out of memory error or a server crash. ([Bug#14885](#))
- **SHOW CREATE DATABASE** was sometimes refused when the client had privileges for the database. ([Bug#9785](#))
- **mysql** ignored the **MYSQL_TCP_PORT** environment variable. ([Bug#5792](#))
- **ROW_COUNT()** returned an incorrect result after **EXECUTE** of a prepared statement. ([Bug#14956](#))
- Invalid casts to **DATE** values now result in a message of **Incorrect datetime value**, rather than **Truncated incorrect datetime value**. ([Bug#8294](#))
- Attempts to assign **NULL** to a **NOT NULL** column in strict mode now result in a message of **Column 'col_name' cannot be null, rather than Column set to default value; NULL supplied to NOT NULL column 'col_name' at row n**. ([Bug#11491](#))
- For binary string data types, **mysqldump --hex-blob** produced an illegal output value of **0x** rather than **'**. ([Bug#13318](#))
- Some comparisons for the **IN()** operator were inconsistent with equivalent comparisons for the **=** operator. ([Bug#12612](#))

C.1.27. Changes in release 5.1.3 (29 November 2005)

Functionality added or changed:

This is the first public alpha release of the current MySQL 5.1 development branch, providing an insight to upcoming features. Although some of these are still under heavy development, this release includes the following new features and changes (in comparison to the current MySQL 5.0 production release):

- **Partitioning**: allows distributing portions of individual tables across a filesystem, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. See [Chapter 17, Partitioning](#), for further information on this functionality. (Author: Mikael Ronström)
- **Plugin API**: MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, *plugin full-text parsers* are a first step in this direction. This allows users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. (Author: Sergey Vojtovich)

The plugin API requires the **mysql.plugin** table. When upgrading from an older version of MySQL, you should run the **mysql_fix_privilege_tables** command to create this table. See [Section 5.5.3, “mysql_fix_privilege_tables —](#)

Upgrade MySQL System Tables”.

Incompatible change: Plugins are installed in the directory named by the `plugin_dir` system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **The Instance Manager (IM)** now has some additional functionality:
 - `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
 - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
 - `SET instance_name.option_name=option_value` sets an option to the specified value and writes it to the config file. See [Section 5.4, “mysqlmanager — The MySQL Instance Manager”](#), for more details on these new commands. (Author: Petr Chardin)
- The performance of boolean full-text searches (using the “+” Operator) has been improved. See [Section 11.8, “Full-Text Search Functions”](#), for more details about full-text searching. (Author: Sergey Vojtovich)
- `VARCHAR` fields used in MySQL Cluster tables are now variable-sized; that is, they now only allocate as much space as required to store the data. Previously, a `VARCHAR(n)` column allocated $n+2$ bytes (aligned to 4 bytes), regardless if the actual inserted value required that much space. (In other words, a `VARCHAR` column always required the same, fixed, amount of storage as a `CHAR` column of the same size.)
- Renamed the `table_cache` system variable to `table_open_cache`. Any scripts that refer to `table_cache` should be updated to use the new name.
- Added the `table_definition_cache` system variable. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache.
- Added the `SHOW AUTHORS` statement.
- Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See [Section 12.5.4.23, “SHOW PROCEDURE CODE and SHOW FUNCTION CODE Syntax”](#).
- `RAND( )` no longer allows non-constant initializers. (Prior to MySQL 5.0.13, the effect of non-constant initializers is undefined.) ([Bug#6172](#))

Bugs fixed:

- Set functions could not be aggregated in outer subqueries. ([Bug#12762](#))

C.1.28. Changes in release 5.1.2 (Not released)

Functionality added or changed:

- Added `MAXLOCKS`, `MINLOCKS`, `MAXWRITE`, and `MINWRITE` as allowable values of the `--bdb-lock-detect` option. ([Bug#14876](#))
- Added the `bdb_cache_parts` and `bdb_region_size` system variables, and allowed `bdb_cache_size` to be larger than 4GB on systems that support it. ([Bug#14895](#))
- Added `Transactions`, `XA`, and `Savepoints` columns to `SHOW ENGINES` output.
- Added `--replace` to `mysqldump`. This option uses `REPLACE INTO`, rather than `INSERT INTO`, when writing the dumpfile.

Bugs fixed:

- Foreign keys were not properly enforced in [TEMPORARY](#) tables. Foreign keys now are disallowed in [TEMPORARY](#) tables. ([Bug#12084](#))

C.1.29. Changes in release 5.1.1 (Not released)

Bugs fixed:

- Performing a [CREATE TABLE](#) statement with a [PARTITION BY](#) clause in a prepared statement could crash a server running in debug mode. ([Bug#12097](#))
- [NDB](#): Specifying the wrong nodegroup in a [CREATE TABLE](#) using partitioning would lead to the table name being locked after the [CREATE TABLE](#) statement failed (that is, the table name could not be re-used). ([Bug#12114](#))
- Using [ORDER BY](#) in a query with a partitioned table on a 64-bit operating system could crash the server. ([Bug#12116](#))
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through [LOCK TABLES](#) and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. ([Bug#10600](#))

C.2. MySQL Connector/ODBC (MyODBC) Change History

C.2.1. Changes in Connector/ODBC 5.0.12 (Not yet released)

Bugs fixed:

- Tables with [TEXT](#) columns would be incorrectly identified, returning an [Unknown SQL type - 65535](#) error. ([Bug#20127](#))
- Inserting [NULL](#) values into a [DATETIME](#) column from Access reports an error. ([Bug#27896](#))

C.2.2. Changes in Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Driver now builds and is partially tested under Linux with the iODBC driver manager.
- Added support for ODBC v2 statement options using attributes.

Bugs fixed:

- Internal function, [my_setpos_delete_ignore\(\)](#) could cause a crash. ([Bug#22796](#))
- Updates of [MEMO](#) or [TEXT](#) columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Fixed occasional mis-handling of the [SQL_NUMERIC_C](#) type.
- Fixed the binding of certain integer types.

C.2.3. Changes in Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Added wide-string type info for `SQLGetTypeInfo()`.
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))

Bugs fixed:

- String query parameters are now escaped correctly. ([Bug#19078](#))
- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))

C.2.4. Changes in Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.
- Added support for column binding as `SQL_NUMERIC_STRUCT`.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed buffer length return for `SQLDriverConnect`.
- Added limit of display size when requested via `SQLColAttribute/SQL_DESC_DISPLAY_SIZE`.
- Fixed statistics to fail if it couldn't be completed.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).

C.2.5. Changes in Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Made distinction between [CHAR/BINARY](#) (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).
- Also made [SQL_DESC_NAME](#) only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.

Bugs fixed:

- Length now used when handling bind parameter (needed in particular for [SQL_WCHAR](#)) - this enables updating char data in MS Access.
- Fixed string length to chars, not bytes, returned by [SQLGetDiagRec](#).
- Fixed using wrong pointer for [SQL_MAX_DRIVER_CONNECTIONS](#) in [SQLGetInfo](#).
- Fixed binding using [SQL_C_LONG](#).
- Allow [SQLDescribeCol](#) to be called to retrieve the length of the column name, but not the name itself.
- Fix size return from [SQLDescribeCol](#).
- Fixed handling of numeric pointers in [SQLColAttribute](#).
- Fixed type returned for [MYSQL_TYPE_LONG](#) to [SQL_INTEGER](#) instead of [SQL_TINYINT](#).
- Fixed [MDiagnostic](#) to use correct v2/v3 error codes.
- Set default return to [SQL_SUCCESS](#) if nothing is done for [SQLSpecialColumns](#).
- Updated retrieval of descriptor fields to use the right pointer types.

C.2.6. Changes in Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Improved trace/log.
- Added support for [SQLStatistics](#) to [MYODBCShell](#).

Bugs fixed:

- Fixed [SQLDescribeCol](#) returning column name length in bytes rather than chars.
- [SQLBindParameter](#) now handles [SQL_C_DEFAULT](#).
- Corrected incorrect column index within [SQLStatistics](#). Many more tables can now be linked into MS Access.

C.2.7. Changes in Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- Connector/ODBC supports both [User](#) and [System](#) DSNs.

C.2.8. Changes in Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

C.2.9. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
 - [SQLBindParameter](#)
 - [SQLBindCol](#)

C.2.10. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

C.2.11. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
 - [SQLAllocHandle](#)
 - [SQLCloseCursor](#)
 - [SQLColAttribute](#)
 - [SQLColumns](#)
 - [SQLConnect](#)

- [SQLCopyDesc](#)
- [SQLDisconnect](#)
- [SQLExecDirect](#)
- [SQLExecute](#)
- [SQLFetch](#)
- [SQLFreeHandle](#)
- [SQLFreeStmt](#)
- [SQLGetConnectAttr](#)
- [SQLGetData](#)
- [SQLGetDescField](#)
- [SQLGetDescRec](#)
- [SQLGetDiagField](#)
- [SQLGetDiagRec](#)
- [SQLGetEnvAttr](#)
- [SQLGetFunctions](#)
- [SQLGetStmtAttr](#)
- [SQLGetTypeInfo](#)
- [SQLNumResultCols](#)
- [SQLPrepare](#)
- [SQLRowcount](#)
- [SQLTables](#)

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- [SQLSetConnectAttr](#)
- [SQLSetDescField](#)
- [SQLSetDescRec](#)
- [SQLSetEnvAttr](#)
- [SQLSetStmtAttr](#)

C.2.12. Changes in Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.5.19 fixes a specific issue with the 3.5.18 release. For a list of changes in the 3.5.18 release, see [Section C.2.13, “Changes in Connector/ODBC 3.51.18 \(08 August 2007\)”](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as [SQL_VARBINARY](#). Until this server bug is corrected, the driver will identify all variable-length strings as [SQL_VARCHAR](#).

C.2.13. Changes in Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as [PKG](#) packages.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality added or changed:

- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option ([FLAG_MULTI_STATEMENTS](#), 67108864, or [ALLOW_MULTIPLE_STATEMENTS](#) within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The [SQL_ATTR_ROW_BIND_OFFSET_PTR](#) is now supported for row bind offsets. ([Bug#6741](#))
- When connecting to a specific database when using a DSN, the system tables from the [mysql](#) database are no longer also available. Previously, tables from the [mysql](#) database (catalog) were listed as [SYSTEM TABLES](#) by [SQLTables\(\)](#) even when a different catalog was being queried. ([Bug#28662](#))
- The [TRACE](#) and [TRACEFILE](#) DSN options have been removed. Use the ODBC driver manager trace options instead.
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. ([Bug#10444](#), [Bug#15326](#))

Bugs fixed:

- The [SQLColumns\(\)](#) function could return incorrect information about [AUTO_INCREMENT](#) columns, indicating that the field was not nullable. ([Bug#14407](#))
- The [SQLColumns\(\)](#) function could return incorrect information about [TIMESTAMP](#) columns, indicating that the field was not nullable. ([Bug#14414](#))
- Obtaining the length of a column when using a character set for the connection of [utf8](#) would result in the length being returned incorrectly. ([Bug#19345](#))
- The [SQL_COLUMN_TYPE](#), [SQL_COLUMN_DISPLAY](#) and [SQL_COLUMN_PRECISION](#) values would be returned incorrectly by [SQLColumns\(\)](#), [SQLDescribeCol\(\)](#) and [SQLColAttribute\(\)](#) when accessing character columns, especially those generated through [concat\(\)](#). The lengths returned should now conform to the ODBC specification. The [FLAG_FIELD_LENGTH](#) option no longer has any affect on the results returned. ([Bug#27862](#))
- The [SQL_DATA_TYPE](#) column in [SQLColumns\(\)](#) results did not report the correct value for date and time types.
- The [SQL_DATETIME_SUB](#) column in [SQLColumns\(\)](#) was not correctly set for date and time types.
- The value for [SQL_DESC_FIXED_PREC_SCALE](#) was not returned correctly for values in MySQL 5.0 and later.
- The wrong value from [SQL_DESC_LITERAL_SUFFIX](#) was returned for binary fields.
- The wrong value for [SQL_DESC_TYPE](#) was returned for date and time types.
- The wrong value for [DECIMAL_DIGITS](#) in [SQLColumns\(\)](#) was reported for [FLOAT](#) and [DOUBLE](#) fields, as well as the wrong

value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.

- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be up-dateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns ([Bug#30081](#)). ([Bug#9927](#))
- Fixed an issue where the `myodbc3i` would update the the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honouring the `s` and `u` modifiers for the `-d` command line option. ([Bug#29964](#))
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. ([Bug#29888](#))
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. ([Bug#28657](#))

C.2.14. Changes in Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- There are no binary packages for Microsoft Windows x64 Edition.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#6667](#), [Bug#9498](#))
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.

Bugs fixed:

- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))

- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug#26934)
- Calling `SQLGetDiagField` with `RecNumber 0`, `DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug#16224)
- Connector/ODBC crashed with Crystal Reports due to a problem with `SQLProcedures()`. (Bug#28316)
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. (Bug#16817)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug#9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. (Bug#8860)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug#10563)

C.2.15. Changes in Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug#12918)

Bugs fixed:

- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. (Bug#27544)
- Using cursors on results sets with multi-column keys could select the wrong value. (Bug#28255)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug#15773)
- Specifying strings as parameters using the `adBSTr` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug#16235)
- Return values from `SQLTables()` may be truncated. (Bugs #22797)
- Data in `TEXT` columns would fail to be read correctly. (Bug#16917)
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug#27723)
- When using the `Don't Cache Results` (option value 1048576) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug#4657)
- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. (Bug#28758)
- `SQLTables()` did not distinguish tables from views. (Bug#23031)
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. (Bug#16235)

C.2.16. Changes in Connector/ODBC 3.51.15 (7 May 2007)

Bugs fixed:

- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug#27220)
- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug#27591)
-
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug#7912)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug#27589)
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not be updated correctly. (Bug#24306)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug#23033)
- Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug#4518)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug#5853)
- The `SQLTransact()` function did not support an empty connection handle. (Bug#21588)

C.2.17. Changes in Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug#19823)
- Added support for the `HENV` handlers in `SQLEndTran()`.
- Added auto-reconnect option to Connector/ODBC option parameters.
- Added auto is null option to Connector/ODBC option parameters. (Bug#10910)

Bugs fixed:

- The ODBC driver name and version number were incorrectly reported by the driver. (Bug#19740)
- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. (Bug#16535)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug#20208)
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug#25846)
- On 64-bit systems, some types would be incorrectly returned. (Bug#26024)
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug#20459)
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug#22446)
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug#20547)
- The `SQLDriverConnect()` ODBC method did not work with recent Connector/ODBC releases. (Bug#12393)

C.2.18. Changes in Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

C.2.19. Changes in Connector/ODBC 3.51.12

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommantType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

C.2.20. Changes in Connector/ODBC 3.51.11

Functionality added or changed: No changes.

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

C.3. Connector/NET Change History

C.3.1. Changes in MySQL Connector/NET Version 5.1.3 (Not yet released)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- Using `TransactionScope` would cause an `InvalidOperationException`. ([Bug#28709](#))
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. ([Bug#29476](#))
- The Saudi Hijri calendar was not supported. ([Bug#29931](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Re-sources.ParameterMustBeDefined`. ([Bug#29312](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))

- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. ([Bug#29235](#))
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. ([Bug#29236](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. ([Bug#29098](#))

C.3.2. Changes in MySQL Connector/NET Version 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Note

Connector/NET 5.1.2 now includes the Visual Studio Plugin by default.

Bugs fixed:

- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. ([Bug#26347](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. ([Bug#28536](#))
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. ([Bug#28437](#))
- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Creating a user would fail due to the application name being set incorrectly. ([Bug#28648](#))
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. ([Bug#28204](#))

C.3.3. Changes in MySQL Connector/NET Version 5.1.1 (23 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Connector/NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. ([Bug#28260](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))

- The **UNSIGNED** flag for parameters in a stored procedure would be ignored when using `MySQLCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Fixed password property on `MySQLConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

C.3.4. Changes in MySQL Connector/NET Version 5.1.0 (01 May 2007)

Functionality added or changed:

This is the first public alpha release of the current Connector/NET 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/NET 5.0 production release):

- Added Membership and Role provider contributed by Sean Wright (thanks!).
- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.

C.3.5. Changes in MySQL Connector/NET Version 5.0.8 (21 August 2007)

Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying **BLOB** fields as binary, rather than text. ([Bug#30233](#))
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under Culture-Info. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))
- Fixed problem where `MySQLConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.
- An incorrect `ConstraintException` could be raised on an **INSERT** when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))

- A `FormatException` error would be raised if a parameter had not been found, instead of `Re-sources.ParameterMustBeDefined`. (Bug#29312)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug#29123)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)

C.3.6. Changes in MySQL Connector/NET Version 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. (Bug#23342)
- Using `MySqlDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug#25947)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug#27240, Bug#26147)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)

C.3.7. Changes in MySQL Connector/NET Version 5.0.6 (22 March 2007)

Bugs fixed:

- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)

- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug#27187)
- Exception thrown when using large values in `UInt64` parameters. (Bug#27093)
- `DESCRIBE . . . .` SQL command returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug#27221)
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. (Bug#26960)

C.3.8. Changes in MySQL Connector/NET Version 5.0.5 (07 March 2007)

Functionality added or changed:

- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.
- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.

Bugs fixed:

- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug#26660)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)
- Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Opening a connection would be slow due to hostname lookup. (Bug#26152).
- Connector/NET would fail to install under Windows Vista. (Bug#26430)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug#25950)
- Registry would be incorrectly populated with installation locations. (Bug#25928)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)

- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. ([Bug#25726](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR Datatype. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. ([Bug#25458](#))
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. ([Bug#24802](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))

C.3.9. Changes in MySQL Connector/NET Version 5.0.4 (Not released)

Connector/NET Version 5.0.4 was not released due to an incomplete bug fix.

C.3.10. Changes in MySQL Connector/NET Version 5.0.3 (05 January 2007)

Functionality added or changed:

- SSL support has been updated.
- The `ViewColumns GetSchema` collection has been updated.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- Improved speed and performance by re-architecting certain sections of the code.
- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- The `MySQLCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `ShapZipLib` library has been replaced with the deflate support provided within .NET 2.0.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.

Bugs fixed:

- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Additional text added to error message ([Bug#25178](#))

- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))

C.3.11. Changes in MySQL Connector/NET Version 5.0.2 (06 November 2006)

Functionality added or changed:

- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.

Bugs fixed:

- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))
- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))

C.3.12. Changes in MySQL Connector/NET Version 5.0.1 (01 October 2006)

Bugs fixed:

- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySQLConversionException` exception would be raised. ([Bug#11991](#))
- An `MySQL.Data.Types.MySQLConversionException` would be raised when trying to update a row that contained a date

field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)

- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug#22042)
- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The `MySqlException` class is now derived from the `DbException` class. (Bug#21874)
- Executing multiple queries as part of a transaction returns `There is already an open DataReader associated with this Connection which must be closed first`. (Bug#7248)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)

C.3.13. Changes in MySQL Connector/NET Version 5.0.0 (08 August 2006)

This is a new Alpha development release, fixing recently discovered bugs.

NOTE: This Alpha release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. (Bug#6214)

Functionality added or changed:

- Implemented Usage Advisor.
- Added Async query methods.
- Reimplemented `PacketReader/PacketWriter` support into `MySqlStream` class.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented `MySqlConnectionBuilder` class.
- Implemented `MySqlClientFactory` class.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.

- Completely refactored how column values are handled to avoid boxing in some cases.

C.3.14. Changes in MySQL Connector/NET Version 1.0.11 (Not yet released)

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))

C.3.15. Changes in MySQL Connector/NET Version 1.0.10 (24 August 2007)

Bugs fixed:

- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `MySQLParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- When a `MySQLConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySQLPool.GetConnection`. ([Bug#24373](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. ([Bug#25605](#))

C.3.16. Changes in MySQL Connector/NET Version 1.0.9 (02 February 2007)

Functionality added or changed:

- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.

- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.

Bugs fixed:

- Trying to fill a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- `MySQLConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. ([Bug#24802](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- Nested transactions do not raise an error or warning. ([Bug#22400](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Additional text added to error message. ([Bug#25178](#))
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. ([Bug#23862](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)
- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. ([Bug#23758](#))
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)

C.3.17. Changes in MySQL Connector/NET Version 1.0.8 (20 October 2006)

Bugs fixed:

- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySQLConversionException` exception would be raised. ([Bug#11991](#))
- The `MySQLDateTime` class did not contain constructors. ([Bug#15112](#))
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `datetime` field with a null value. ([Bug#16884](#))
- An `MySQL.Data.Types.MySQLConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- When using `MySQLDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. ([Bug#8131](#))

- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Calling `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no parameters would cause an application crash. (Bug#15077)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug#17736)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug#19481)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- The connection string parser did not allow single or double quotes in the password. (Bug#16659)
- The `CommandBuilder` ignored `Unsigned` flag at `Parameter` creation. (Bug#17375)
- `CHAR` type added to `MySqlDbType`. (Bug#17749)
- Unsigned data types were not properly supported. (Bug#16788)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

C.3.18. Changes in MySQL Connector/NET Version 1.0.7 (21 November 2005)

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)

- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#))
- Added support for the `cp932` character set. ([Bug#13806](#))
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. ([Bug#13753](#))
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))
- The `Ping()` method did not update the `State` property of the `Connection` object. ([Bug#13658](#))

C.3.19. Changes in MySQL Connector/NET Version 1.0.6 (03 October 2005)

- The `nant` build sequence had problems. ([Bug#12978](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `( )%<>/` ([Bug#13036](#))
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. ([Bug#12835](#))
- Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))

C.3.20. Changes in MySQL Connector/NET Version 1.0.5 (29 August 2005)

- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Decimal parameters caused syntax errors. ([Bug#11550](#), [Bug#10486](#), [Bug#10152](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Connector/NET could not work properly with certain regional settings. (WL#8228)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))
- Added support to call a stored function from Connector/NET. ([Bug#10644](#))
- Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))

C.3.21. Changes in MySQL Connector/NET Version 1.0.4 (20 January 2005)

- Calling prepare causing exception. ([Bug#7243](#))
- Fixed another small problem with prepared statements.
- `MySqlCommand.Connection` returns an `IDbConnection`. ([Bug#7258](#))
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. ([Bug#7345](#))
- Clone method bug in `MySqlCommand`. ([Bug#7478](#))
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. ([Bug#7612](#))
- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))
- `GetBytes` is working no more. ([Bug#7704](#)).
- Quote character `\222` not quoted in `EscapeString`. ([Bug#7724](#))
- Fixed problem that causes named pipes to not work with some blob functionality.
- Fixed problem with shared memory connections.
- Problem with Multiple resultsets. ([Bug#7436](#))
- Added or filled out several more topics in the API reference documentation.

C.3.22. Changes in MySQL Connector/NET Version 1.0.3-gamma (12 October 2004)

- Made MySQL the default named pipe name.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Fixed Invalid character set index: 200. ([Bug#6547](#))
- Installer now includes options to install into GAC and create `START MENU` items.
- Int64 Support in `MySqlCommand` Parameters. ([Bug#6863](#))
- Connections now do not have to give a database on the connection string.
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. ([Bug#6770](#))
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Exception stack trace lost when re-throwing exceptions. ([Bug#6983](#))
- Fixed major problem with detecting null values when using prepared statements.
- Errors in parsing stored procedure parameters. ([Bug#6902](#))
- Integer "out" parameter from stored procedure returned as string. ([Bug#6668](#))
- `MySqlDateTime` in Databases sorting by Text, not Date. ([Bug#7032](#))
- Invalid query string when using inout parameters ([Bug#7133](#))
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. ([Bug#6831](#))
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. ([Bug#7132](#))

- InvalidCast when using `DATE_ADD`-function. ([Bug#6879](#))
- An Open Connection has been Closed by the Host System. ([Bug#6634](#))
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySQL.Data.Tests.dll`.

C.3.23. Changes in MySQL Connector/NET Version 1.0.2-gamma (15 November 2004)

- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed double type handling in `MySqlParameter(string parameterName, object value)` ([Bug#6428](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.
- Added charset connection string option
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Updated the installer to include the new samples
- Fixed Long inserts take very long time (Bu #5453)
- Fixed Objects not being disposed ([Bug#6649](#))
- Provider is now using character set specified by server as default

C.3.24. Changes in MySQL Connector/NET Version 1.0.1-beta2 (27 October 2004)

- Fixed [Bug#5602](#) Possible bug in `MySqlParameter(string, object)` constructor
- Fixed [Bug#5458](#) Calling `GetChars` on a longtext column throws an exception
- Fixed [Bug#5474](#) cannot run a stored procedure populating `mysqlcommand.parameters`
- Fixed [Bug#5469](#) Setting `DbType` throws `NullReferenceException`
- Fixed problem where connector was not issuing a `CMD_QUIT` before closing the socket
- Fixed [Bug#5392](#) `MySqlCommand` sees "?" as parameters in string literals
- Fixed problem with `ConnectionInternal` where a key might be added more than once
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5388](#) `DataReader` reports all rows as NULL if one row is NULL

- Virtualized driver subsystem so future releases could easily support client or embedded server support
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed problem where using old syntax while using the interfaces caused problems
- Using PacketWriter instead of Packet for writing to streams
- Refactored compression code into CompressedStream to clean up NativeDriver
- Added test case for resetting the command text on a prepared command
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed constructor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](#))
- Added Aggregate function test (wasn't really a bug)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed problem where Min Pool Size was not being respected
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Implemented SequentialAccess
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed Russian character support as well
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed GetBoolean returns wrong values ([Bug#6227](#))
- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](#))

C.3.25. Changes in MySQL Connector/NET Version 1.0.0 (01 September 2004)

- Thai encoding not correctly supported. ([Bug#3889](#))
- Updated many of the test cases.
- Fixed problem with using compression.

- Bumped version number to 1.0.0 for beta 1 release.
- Added [COPYING.rtf](#) file for use in installer.
- Removed all of the XML comment warnings.
- Removed some last references to ByteFX.

C.3.26. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a [SerializeBinary](#) method for sending their data to a [PacketWriter](#).
- Added [PacketWriter](#) class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- [SingleRow](#) behavior now working right even with limit.
- [GetBytes](#) now only works on binary columns.
- Logger now truncates long sql commands so blob columns don't blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. ([Bug#5214](#))
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where [GetSchema](#) would return false for [IsUnique](#) when the column is key.
- [MySqlDataReader](#) [GetXXX](#) methods now using the field level [MySqlValue](#) object and not performing conversions.
- [DataReader](#) returning NULL for time column. ([Bug#5097](#))
- Added test case for [LOAD DATA LOCAL INFILE](#).
- Added replacetext custom nant task.
- Added [CommandBuilderTest](#) fixture.
- Added Last One Wins feature to [CommandBuilder](#).
- Fixed persist security info case problem.
- Fixed [GetBool](#) so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.
- [MySqlCommandBuilder](#). ([Bug#4658](#))
- [ByteFX.MySqlClient](#) caches passwords if [Persist Security Info](#) is false. ([Bug#4864](#))
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added [MySqlField41](#) as a subclass of [MySqlField](#).

- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` don't works correctly. ([Bug#4324](#))
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added `CRInSQL` test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. ([Bug#4074](#))
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.

- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySQLInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySQL.Data.MySqlClient`.
- Changed assembly name of client to `MySQL.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySQLClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into `notused` folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySQL 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySQL.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.

- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added [TimeSpan](#) code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added [TimeStamp](#) to parameter serialization code. Prevented [DataAdatper](#) updates from working right (thanks Michael King).
- Fixed a misspelling in [MySQLHelper.cs](#) (thanks Patrick Kristiansen).

C.3.27. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to [MySQLClient.Design](#).
- Fixed bug in [Version.isAtLeast](#).
- Changed [DBConnectionString](#) to support changes done to [MySQLConnectionString](#).
- Removed [SqlCommandEditor](#) and [DataAdapterPreviewDialog](#).
- Using new long return values in many places.
- Integrated new [CompressedStream](#) class.
- Changed [ConnectionString](#) and added attributes to allow it to be used in [MySQLClient.Design](#).
- Changed [packet.cs](#) to support newer lengths in [ReadLenInteger](#).
- Changed other classes to use new properties and fields of [MySQLConnectionString](#).
- [ConnectionInternal](#) is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.
- Changed [field.cs](#) to allow values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in [StreamCreator](#) where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from [command.cs](#).
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

C.3.28. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a username is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

C.3.29. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.

- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the `MySqlPool` (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perken-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL command throws an exception (thanks Burkhard Perken-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).

- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guxt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

C.3.30. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

C.3.31. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both in- to the server and out.

- Added [MySQLStream](#) class to simplify timeouts and driver coding.
- Fixed [DataReader](#) so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more [SqlClient](#) compliant so that [DataReaders](#) have to be closed before the connection can be used to run another command.
- Improved [DBNull.Value](#) handling in the fields.
- Added several unit tests.
- Fixed [MySQLException](#) base class.
- Improved driver coding
- Fixed bug where [NextResult](#) was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to [Int64](#) and unsigned 16bit values to [Int32](#), and so forth.
- Added new constructor for [MySQLParameter](#) for (name, type, size, srccol)
- Fixed bug in [MySQLDataReader](#) where it didn't check for null fieldlist before returning field count.
- Started adding [MySQLClient](#) unit tests (added [MySQLClient/Tests](#) folder and some test cases).
- Fixed some things in Connection String handling.
- Moved [INIT_DB](#) to [MySQLPool](#). I may move it again, this is in preparation of the conference.
- Fixed bug inside [CommandBuilder](#) that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of [Command](#) worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of [CoonnectionPooling](#) is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of [Parameter](#).
- Also, inferred type if value of null parameter is changed using [Value](#) property.
- Converted all files to use proper Camel case. MySQL is now [MySql](#) in all files. [PgSQL](#) is now [PgSql](#).
- Added attribute to [PgSql](#) code to prevent designer from trying to show.
- Added [MySQLDbType](#) property to [Parameter](#) object and added proper conversion code to convert from [DbType](#) to [MySQLDbType](#)).
- Removed unused [ObjectToString](#) method from [MySQLParameter.cs](#).
- Fixed [Add\(. . \)](#) method in [ParameterCollection](#) so that it doesn't use [Add\(name, value\)](#) instead.
- Fixed [IndexOf](#) and [Contains](#) in [ParameterCollection](#) to be aware that parameter names are now stored without @.
- Fixed [Command.ConvertSQLToBytes](#) so it only allows characters that can be in MySQL variable names.
- Fixed [DataReader](#) and [Field](#) so that blob fields read their data from [Field.cs](#) and [GetBytes](#) works right.
- Added simple query builder editor to [CommandText](#) property of [MySQLCommand](#).

- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

C.3.32. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters like ä will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

C.3.33. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

C.3.34. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.

- Work done to improve [Timestamp](#) data type handling.
- Implemented [IEnumerable](#) on [DataReader](#) so [DataGrid](#) would work.

C.3.35. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to [TIMESTAMP](#) and [DATETIME](#) fields fixed.

C.4. MySQL Visual Studio Plugin Change History

Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section C.3, "Connector/NET Change History"](#).

C.4.1. Changes in MySQL Visual Studio Plugin 1.1.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the dataset designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

C.4.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. ([Bug#24875](#))

C.4.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft .Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySQL.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySQL.Data.MySqlClient.MySqlClientFactory, MySQL.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySQL.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySQL.Data.MySqlClient.MySqlClientFactory, MySQL.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

C.4.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

This is the first beta release.

Features in this release:

- DDEX (Data Designer Extensibility) compatibility.
- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.

C.5. MySQL Connector/J Change History

C.5.1. Changes in MySQL Connector/J 5.1.x

C.5.1.1. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

Functionality added or changed:

- Connector/J now connects using an initial character set of **utf-8** solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. ([Bug#29853](#))
- Added two configuration parameters:
 - **blobsAreStrings** Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for **GROUP BY** clauses. Defaults to false.
 - **functionsNeverReturnBlobs** Should the driver always treat data from functions returning **BLOBs** as Strings. Added specifically to work around dubious metadata returned by the server for **GROUP BY** clauses. Defaults to false.
- Setting **rewriteBatchedStatements** to **true** now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has **BLOB** or **TEXT** types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property **largeRowSizeThreshold**, which has a default value of 2KB.
- The data (and how it's stored) for **ResultSet** rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" via the **com.mysql.jdbc.StatementInterceptor** interface, examples are in [com/mysql/jdbc/interceptors](#). Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable **net_write_timeout** when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named **netTimeoutForStreamingResults**, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- Support for JDBC-4.0 **NCHAR**, **NVARCHAR** and **NCLOB** types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via **SHOW PROCESSLIST** on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.
- JDBC-4.0 ease-of-development features including auto-registration with the **DriverManager** via the service provider mechanism, standardized Connection validity checks and categorized **SQLExceptions** based on recoverability/retry-ability and class of the underlying error.

- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to `false`, the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
 - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from sub-queries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. ([Bug#30550](#))
- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". ([Bug#29106](#))

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `"/ * ping */"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

C.5.1.2. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by `;`) if they are not plain (*i.e.* without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

C.5.1.3. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for pluggability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it's stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.

- Similar to [Connection](#), we pulled out vendor extensions to [Statement](#) into an interface named [com.mysql.Statement](#), and moved the [Statement](#) class into [com.mysql.StatementImpl](#). The two methods (javadoc'd in [com.mysql.Statement](#) are [enableStreamingResults\(\)](#), which already existed, and [disableStreamingResults\(\)](#) which sets the statement instance back to the fetch size and result set type it had before [enableStreamingResults\(\)](#) was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has [BLOB](#) or [TEXT](#) types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property [largeRowSizeThreshold](#), which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the [com.mysql.jdbc.StatementInterceptor](#) interface, examples are in [com/mysql/jdbc/interceptors](#).

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

[StatementInterceptors](#) are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property [statementInterceptors](#).

- See the sources (fully javadoc'd) for [com.mysql.jdbc.StatementInterceptor](#) for more details until we iron out the API and get it documented in the manual.
- Setting [rewriteBatchedStatements](#) to [true](#) now causes [CallableStatements](#) with batched arguments to be rewritten in the form [CALL \(...\); CALL \(...\); ...](#) to send the batch in as few client-server round trips as possible.

C.5.1.4. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is [false](#) (that is, Connector/J does not use server-side prepared statements).

Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the [useTimezone=true](#) connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set [useSSPSCompatibleTimezoneShift=true](#).

Functionality added or changed:

- Refactored [CommunicationsException](#) into a JDBC-3.0 version, and a JDBC-4.0 version (which extends [SQLRecoverableException](#), now that it exists).

Note

This change means that if you were catching [com.mysql.jdbc.CommunicationsException](#) in your applications instead of looking at the [SQLState](#) class of [08](#), and are moving to Java 6 (or newer), you need to change your imports to that exception to be [com.mysql.jdbc.exceptions.jdbc4.CommunicationsException](#), as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized [SQLExceptions](#).
- Added support for JDBC-4.0's [NCLOB](#), and [NCHAR/NVARCHAR](#) types.

- `com.mysql.jdbc.java6.javac` full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's SQLXML interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

 - `com.mysql.jdbc.java6.javac` full path to your Java-6 `javac` executable
 - `com.mysql.jdbc.java6.rtjar` full path to your Java-6 `rt.jar` file
- New feature driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.
- `com.mysql.jdbc.java6.rtjar` full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

C.5.2. Changes in MySQL Connector/J 5.0.x

C.5.2.1. Changes in MySQL Connector/J 5.0.8 (Not yet released)

Functionality added or changed:

- `blobsAreStrings` Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
 - `blobsAreStrings` Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs` Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from sub-queries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))

- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

C.5.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a `Statement` or `ResultSet`) by using fully-materialized cursors on the server.
- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK ≥ 1.5)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a non-zero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- Added configuration properties to allow tuning of TCP/IP socket parameters:
 - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
 - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
 - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default

value for this property.

- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Give more information in EOFExceptions thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.

Bugs fixed:

- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.
As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECTs` for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))
- Parser in client-side prepared statements eats character following `'` if it's not a multi-line comment. ([Bug#28851](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for `'#` comments. Also added support for `'-` single-line comments. ([Bug#28956](#))
- Don't send any file data in response to `LOAD DATA LOCAL INFILE` if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))

C.5.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. ([Bug#25545](#))
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. ([Bug#26592](#))
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. ([Bug#25624](#))
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. ([Bug#26173](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. ([Bug#26789](#))
- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. ([Bug#25517](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation. ([Bug#27400](#))

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. ([Bug#25328](#))
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. ([Bug#25715](#))
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however).

C.5.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Added configuration property `localSocketAddress`, which is the hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it's useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.
- Fixed logging of XA commands sent to server, it's now configurable via `logXaCommands` property (defaults to `false`).
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.

Bugs fixed:

- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Client-side prepared statement parser gets confused by in-line comments `/* ... */` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSet` -

MetaData.

- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. ([Bug#24065](#))
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). ([Bug#21438](#))
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. ([Bug#25514](#))
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". ([Bug#25009](#))
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. ([Bug#25047](#))
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. ([Bug#21480](#))
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. ([Bug#23303](#))
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. ([Bug#25399](#))
- `INOUT` parameters in `CallableStatements` get doubly-escaped. ([Bug#25379](#))
- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). ([Bug#26326](#))
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). ([Bug#21267](#))

Other changes:

- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.

- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*`(), rather than `RuntimeException`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).

C.5.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between `findColumn()` and `rsmd.getColumnNames()`, usually manifests itself as "Can't find column (")" exceptions. ([Bug#21379](#))
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. ([Bug#21544](#))
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. ([Bug#22024](#))
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. ([Bug#22359](#))
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). ([Bug#22297](#))
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. ([Bug#22456](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. ([Bug#22613](#))

Other changes:

- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- Driver now supports `{call sp}` (without "()" if procedure has no arguments).
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*`() methods.

C.5.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006)

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](#))
- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug#20650)

C.5.2.7. Changes in MySQL Connector/J 5.0.2-beta (11 July 2006)

- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. (Bug#18086)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169)
- Fixed `MySQLValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug#20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets.
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option).
- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager.

C.5.2.8. Changes in MySQL Connector/J 5.0.1-beta (Not Released)

Not released due to a packaging error

C.5.2.9. Changes in MySQL Connector/J 5.0.0-beta (22 December 2005)

- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Attempt detection of the MySQL type `BINARY` (it's an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Return original column name for `RSMD.getColumnNames()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.

- Setting `useJDBCCompliantTimezoneShift=true` (it's not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).
- Added unit tests for `XADataSource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](#))
- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...`
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes).
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support.
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer).
- When fix for [Bug#14562](#) was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`.
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to [Bug#14972](#).
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

C.5.3. Changes in MySQL Connector/J 3.1.x

C.5.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

C.5.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

- Fixed updatable result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. ([Bug#20479](#))
- Fixed Updatable result set that contains a `BIT` column fails when server-side prepared statements are used. ([Bug#20485](#))

- Fixed memory leak with profileSQL=true. ([Bug#16987](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddr with null content. ([Bug#16791](#))
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- ResultSet.getSomeInteger() doesn't work for BIT(>1). ([Bug#21062](#))
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. ([Bug#18880](#))
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). ([Bug#20888](#))
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException.
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). ([Bug#21207](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR.
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'.
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down.
- Fixed [Bug#18258](#) - DatabaseMetaData.getTables(), columns() with bad catalog parameter threw exception rather than return empty result set (as required by spec).
- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it's required to check this property.
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2").

C.5.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

- **INOUT** parameter does not store **IN** value. ([Bug#15464](#))
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](#))
- `PreparedStatement.setObject()` serializes **BigInteger** as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an **UNSIGNED LONG** type). ([Bug#15383](#))
- `ResultSet.getShort()` for **UNSIGNED TINYINT** returned wrong values. ([Bug#11874](#))
- **lib-nodist** directory missing from package breaks out-of-box build. ([Bug#15676](#))
- `DBMD.getColumns()` returns wrong type for **BIT**. ([Bug#15854](#))
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](#))

- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](#))
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably. ([Bug#13469](#))

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this.
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property.
- LogFactory now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger".
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](#))
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](#))
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL.
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](#))
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](#))
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0.
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties.
- Fixed data truncation and `getWarnings()` only returns last warning in set. ([Bug#18740](#))
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. ([Bug#18496](#))
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#))
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. ([Bug#17450](#))
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. ([Bug#19282](#))
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire.
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently ([Bug#13601](#)).
- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. ([Bug#19615](#))
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#))

C.5.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.
- Java type conversion may be incorrect for `MEDIUMINT`. ([Bug#14562](#))
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior).
- Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](#))
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](#))
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. ([Bug#12975](#))
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse).
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](#))
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](#))
- `logSlowQueries` should give better info. ([Bug#12230](#))
- Extraneous sleep on `autoReconnect`. ([Bug#13775](#))
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](#))

- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Process escape tokens in `Connection.prepareStatement(...)`. (Bug#15141) You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`.
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)

C.5.3.5. Changes in MySQL Connector/J 3.1.11-stable (07 October 2005)

- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- Fixed statements generated for testcases missing `;` for “plain” statements.
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type.
- Moved source code to Subversion repository.
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements.
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug#11879)
- Properties shared between master and slave with replication connection. (Bug#12218)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed.
- Geometry types not handled with server-side prepared statements. (Bug#12104)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug#11976)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side).
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`.

- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`.
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`: ([Bug#12541](#))
 - `getBestRowIdentifier()`
 - `getColumns()`
 - `getCrossReference()`
 - `getExportedKeys()`
 - `getImportedKeys()`
 - `getIndexInfo()`
 - `getPrimaryKeys()`
 - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
 - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list.
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. ([Bug#12753](#))
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](#))
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `send-BlobChunkSize` which is 1M.
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters.
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. ([Bug#12752](#))
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `Database-MetaData.getColumns()`. ([Bug#12970](#))
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`.
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. ([Bug#13277](#))
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types.

- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it).
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch.
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it's reading the response to the empty `LOAD DATA INFILE` packet sent to the server.
- Workaround for [Bug#13374](#): `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances).
- URL configuration parameters don't allow `'&'` or `'='` in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>). ([Bug#13453](#))

If the `'%'` character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of `'%'` when using application/x-www-form-urlencoded encoding.
- The configuration property `sessionVariables` now allows you to specify variables that start with the `'@'` sign.
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. ([Bug#13043](#))

C.5.3.6. Changes in MySQL Connector/J 3.1.10-stable (23 June 2005)

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.
- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.

C.5.3.7. Changes in MySQL Connector/J 3.1.9-stable (22 June 2005)

- Overhaul of character set configuration, everything now lives in a properties file.
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. ([Bug#9064](#))
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. ([Bug#10144](#))
- Actually write manifest file to correct place so it ends up in the binary jar file.
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work.
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. ([Bug#10156](#))
- Double quotes not recognized when parsing client-side prepared statements. ([Bug#10155](#))
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`.
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements.
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions.

- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it.
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact.
- Driver doesn't support `{?=CALL( ... )}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Date`s and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug#10485)
- The datatype returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`.
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug#10496)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`.
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`.
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches.
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event.
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required.
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[, ?]` in statements being prepared, as the server supports those types of queries now.
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog.
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
 - `maxPerformance` — maximum performance without being reckless
 - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query.
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter.

- Production package doesn't include JBoss integration classes. ([Bug#11411](#))
- Removed nonsensical “costly type conversion” warnings when using usage advisor.

C.5.3.8. Changes in MySQL Connector/J 3.1.8-stable (14 April 2005)

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. ([Bug#8868](#))
- `ServerPreparedStatement` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB).
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements.
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`.
- Fixed regression in `ping()` for users using `autoReconnect=true`.
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#))
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive filesystems. ([Bug#8800](#))
- Cannot use `UTF-8` for `characterSetResults` configuration property. ([Bug#9206](#))
- A continuation of [Bug#8868](#), where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)` `CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. ([Bug#9236](#))
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). ([Bug#8792](#))
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). ([Bug#8803](#))
- Check for empty strings (`' '`) when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyString-sConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2).
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. ([Bug#9320](#))
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements.
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available.
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySQLConnectionTester`.
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not.

- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](#))
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection.
- Stored procedures with `DECIMAL` parameters with storage specifications that contained ‘,’ in them would fail. ([Bug#9682](#))
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances.
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](#))
- The performance metrics feature now gathers information about number of tables referenced in a SELECT.
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it's available,
 2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. ([Bug#9778](#))
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements.
- Added a `Manifest.MF` file with implementation information to the `.jar` file.
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings.
- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it's not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9917](#))
- Should accept `null` for name patterns in DBMD (meaning ‘%’), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9769](#))

C.5.3.9. Changes in MySQL Connector/J 3.1.7-stable (18 February 2005)

- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. ([Bug#7715](#))
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately.
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton).
- Infinite recursion when “falling back” to master in failover configuration. ([Bug#7952](#))
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration.
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand.

- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads.
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`.
- Always return `byte[]`s for output parameters registered as `*BINARY`.
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`.
- Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement.
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`.
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should).
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed.
- `PreparedStatements` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question.
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server.
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement.
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called.

C.5.3.10. Changes in MySQL Connector/J 3.1.6-stable (23 December 2004)

- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.
- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)

C.5.3.11. Changes in MySQL Connector/J 3.1.5-gamma (02 December 2004)

- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient

`String` instance.

- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql_stmt_execute()".
- Handle case when string representation of timestamp contains trailing '.' with no numbers following it.
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`.
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatement` (set to old, less performant behavior by setting property `dynamicCalendars=true`).
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector.
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359.
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359.
- Use null-safe-equals for key comparisons in updatable result sets.
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all "padding" zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentiferQuoteString()` when building DBMD queries.
- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server.
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`).
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`.
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`.
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)

C.5.3.12. Changes in MySQL Connector/J 3.1.4-beta (04 September 2004)

- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` - `> Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x.
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking

field metadata. ([Bug#4642](#))

- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes via `useFastIntParsing=false` property.
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`’s “standard” description, followed by the server’s error message). This property is set to `true` by default.
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. ([Bug#4689](#))
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order.
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. ([Bug#4482](#))
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed.
- `ServerPreparedStatement` dealing with return of `DECIMAL` type don’t work. ([Bug#5012](#))
- `ResultSet.getObject()` doesn’t return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for “pseudo” bit type). ([Bug#5032](#))
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java’s built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`.
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance).
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`.
- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it’s currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn’t work at various times because data wasn’t available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatement` throwing `ArrayIndexOutOfBoundsException`.
- Use `com.mysql.jdbc.Message`’s classloader when loading resource bundle, should fix sporadic issues when the caller’s classloader can’t locate the resource bundle.

C.5.3.13. Changes in MySQL Connector/J 3.1.3-beta (07 July 2004)

- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.
- Null bitmask sent for server-side prepared statements was incorrect. ([Bug#4119](#))
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`.
- Added packet debugging code (see the `enablePacketDebug` property documentation).
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes).
- Externalized more messages (on-going effort).
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. ([Bug#4311](#))
- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`.

- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`.

C.5.3.14. Changes in MySQL Connector/J 3.1.2-alpha (09 June 2004)

- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug#3146)
- Correctly detect initial character set for servers $\geq 4.1.0$.
- Cleaned up detection of server properties.
- Support placeholder for parameter metadata for server $\geq 4.1.2$.
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate.
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1).
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)
- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs).

C.5.3.15. Changes in MySQL Connector/J 3.1.1-alpha (14 February 2004)

- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set

to a multi-byte encoding (usually affecting retrieval of numeric values).

- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Centralized setting of result set type and concurrency.
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `Data-Source` properties.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Removed `useFastDates` connection property.
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. ([Bug#1673](#))
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch.
- Detect collation of column for `RSMD.isCaseSensitive()`.
- Fixed sending of queries larger than 16M.
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer.
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`.
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`.

- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatement` and their resultant result sets.
- Display where/why a connection was implicitly closed (to aid debugging).
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called.
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. ([Bug#2359](#))
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`.
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server.
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch.
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements.
- Fixed charset conversion issue in `getTables()`. ([Bug#2502](#))
- Implemented multiple result sets returned from a statement or stored procedure.
- Server-side prepared statements were not returning datatype `YEAR` correctly. ([Bug#2606](#))
- Enabled streaming of result sets from server-side prepared statements.
- Class-cast exception when using scrolling result sets and server-side prepared statements. ([Bug#2623](#))
- Merged unbuffered input code from 3.0.
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code.
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. ([Bug#2671](#))
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests.
- Use DocBook version of docs for shipped versions of drivers.

C.5.3.16. Changes in MySQL Connector/J 3.1.0-alpha (18 February 2003)

- Added `requireSSL` property.
- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

C.5.4. Changes in MySQL Connector/J 3.0.x

C.5.4.1. Changes in MySQL Connector/J 3.0.17-ga (23 June 2005)

- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](#))
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](#))

- Support new protocol type `MYSQL_TYPE_VARCHAR`.
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer.
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- `PreparedStatement` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Backported `SQLState` codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1).
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`.
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter.
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, fixed while fixing Bug#7607)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812)
- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values.
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version.
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`.
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later.

C.5.4.2. Changes in MySQL Connector/J 3.0.16-ga (15 November 2004)

- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type.

- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664)
- Made `TINYINT(1)` -> `BIT/Boolean` conversion configurable via `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box).
- Only set `character_set_results` during connection establishment if server version $\geq 4.1.1$.
- Fixed regression where `useUnbufferedInput` was defaulting to `false`.
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)

C.5.4.3. Changes in MySQL Connector/J 3.0.15-production (04 September 2004)

- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts. (**Warning:** This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature. (Bug#4334)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`.
- Removed redundant calls to `checkRowPos()` in `ResultSet`.
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption.
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4138, Bug#4860)
- “Production” is now “GA” (General Availability) in naming scheme of distributions.
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for non-binary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Parse new time zone variables from 4.1.x servers.
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion.

C.5.4.4. Changes in MySQL Connector/J 3.0.14-production (28 May 2004)

- Fixed URL parsing error.

C.5.4.5. Changes in MySQL Connector/J 3.0.13-production (27 May 2004)

- Using a `MySQLDataSource` without server name fails. (Bug#3848)
- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)

C.5.4.6. Changes in MySQL Connector/J 3.0.12-production (18 May 2004)

- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Backport documentation tooling from 3.1 branch.
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. (Bug#103).
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. (Bug#2670).
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting.
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers $\geq 4.1.2$.
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets.
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL $\geq 4.1.0$.
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column.
- Only set `character_set_results` for MySQL $\geq 4.1.0$.
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`.
- Not specifying database in URL caused `MalformedURLException` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property.
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly.
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse).
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Inconsistent reporting of data type. The server still doesn't return all types for `*BLOBs` `*TEXT` correctly, so the driver won't return those correctly. (Bug#3570)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)

- Fixed regression in `PreparedStatement.setString()` and eastern character encodings.
- Made `StringRegressionTest` 4.1-unicode aware.

C.5.4.7. Changes in MySQL Connector/J 3.0.11-stable (19 February 2004)

- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Fixed failover always going to last host in list. (Bug#2578)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server.
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance).
- Issue connection events on all instances created from a `ConnectionPoolDataSource`.

C.5.4.8. Changes in MySQL Connector/J 3.0.10-stable (13 January 2004)

- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch.
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements.
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password.
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type.
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query.
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server.

- Autoreconnect code didn't set catalog upon reconnect if it had been changed.
- Implement `ResultSet.updateClob()`.
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns.
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence `{fn convert ... }`. (Bug#1914)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`.
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`.
- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default).
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible.
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`).
- Use constants for `SQLStates`.
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer.
- Ensure that `Buffer.writeString()` saves room for the `\0`.
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0
- Fixed mappings in `SQLError` to report deadlocks with `SQLStates` of `41000`.
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not.

C.5.4.9. Changes in MySQL Connector/J 3.0.9-stable (07 October 2003)

- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query.
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#517, Bug#664)
- Backported 4.1 protocol changes from 3.1 branch (server-side `SQL` states, new field information, larger client capability flags, connect-with-database, and so forth).
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug#675)

- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`.
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance).
- Don't try and reset isolation level on reconnect if MySQL doesn't support them.
- Don't wrap `SQLExceptions` in `RowDataDynamic`.
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774)
- Fixed regression in large split-packet handling. (Bug#848)
- Better diagnostic error messages in exceptions for “streaming” result sets.
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases).
- Don't hide messages from exceptions thrown in I/O layers.
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN.
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time.
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099)
- Fixed deadlock issue with `Statement.setMaxRows()`.
- Fixed `CLOB.truncate()`. (Bug#1130)
- Optimized `CLOB.setCharacterStream()`. (Bug#1131)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MySQLDataSourceFactory`. (Bug#1246)
- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch.
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports.
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.

C.5.4.10. Changes in MySQL Connector/J 3.0.8-stable (23 May 2003)

- Allow bogus URLs in `Driver.getPropertyInfo()`.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Use JVM charset with filenames and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.

- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](#)).
- Return correct number of generated keys when using `REPLACE` statements.
- Fix problem detecting server character set in some cases.
- Fix row data decoding error when using very large packets.
- Optimized row data decoding.
- Issue exception when operating on an already closed prepared statement.
- Fixed SJIS encoding bug, thanks to Naoto Sato.
- Optimized usage of `EscapeProcessor`.
- Allow multiple calls to `Statement.close()`.

C.5.4.11. Changes in MySQL Connector/J 3.0.7-stable (08 April 2003)

- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- 4.1 Column Metadata fixes.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- Fixed charset issues with database metadata (charset was not getting set correctly).
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Fixed escaping of 0x5c ('\\') character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.

C.5.4.12. Changes in MySQL Connector/J 3.0.6-stable (18 February 2003)

- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.

- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Backported 4.1 charset field info changes from Connector/J 3.1.

C.5.4.13. Changes in MySQL Connector/J 3.0.5-gamma (22 January 2003)

- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`s.
- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added update options for foreign key metadata.

C.5.4.14. Changes in MySQL Connector/J 3.0.4-gamma (06 January 2003)

- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for quoted identifiers in `PreparedStatement` parser.
- Streamlined character conversion and `byte[]` handling in `PreparedStatement`s for `setByte()`.
- Reduce memory footprint of `PreparedStatement`s by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for 4.0.8-style large packets.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.

C.5.4.15. Changes in MySQL Connector/J 3.0.3-dev (17 December 2002)

- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.
- Fixed charset handling in `Fields.java`.
- Implemented `Connection.nativeSQL()`.
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `test-suite.EscapeProcessingTest`).
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.

C.5.4.16. Changes in MySQL Connector/J 3.0.2-dev (08 November 2002)

- Fixed issue with updatable result sets and `PreparedStatement`s not working.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed various non-ASCII character encoding issues.

- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Added SSL support. See [README](#) for information on how to use it.
- Properly restore connection properties when `autoReconnecting` or failing-over, including `autoCommit` state, and isolation level.
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Escape `0x5c` character in strings for the SJIS charset.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Implemented `Clob.truncate()`.
- Implemented `Clob.setString()`.
- Implemented `Clob.setAsciiStream()`.
- Implemented `Clob.setCharacterStream()`.
- Added `com.mysql.jdbc.MinorAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.

C.5.4.17. Changes in MySQL Connector/J 3.0.1-dev (21 September 2002)

- Fixed `ResultSet.getRow()` off-by-one bug.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- Added `socketTimeout` parameter to URL.
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as hostnames,

ports, or usernames), as well as clearing “sensitive” data structures when possible.

- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Implemented `ResultSet.getCharacterStream()`.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Massive code clean-up to follow Java coding conventions (the time had come).

C.5.4.18. Changes in MySQL Connector/J 3.0.0-dev (31 July 2002)

- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- The driver now only works with JDK-1.2 or newer.
- Added multi-host failover support (see [README](#)).
- General source-code cleanup.
- Overall speed improvements via controlling transient object creation in `MysqlLIO` class when reading packets.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.

C.5.5. Changes in MySQL Connector/J 2.0.x

C.5.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

- More code cleanup.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)

- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, `'` will be used as an identifier quote character, otherwise ``` will be used.
- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- Fixed typo for `relaxAutoCommit` parameter.

C.5.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

- More code cleanup.
- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PreparedStatement`.
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- `ResultSetMetaData.getColumnClassName()` now implemented.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)

C.5.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

- General code cleanup.
- Added `getIdleFor()` method to `Connection` and `MySQLLogicalHandle`.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Added support for `BIT` types (51870) to `PreparedStatement`.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `YEAR` type (533556).
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.

- `ResultSet.refreshRow()` implemented.
- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.

C.5.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- Full synchronization of `Statement.java`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

C.5.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).
- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).

C.5.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed quoting error with escape processor (bug 486265).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- Fixed casting bug in `PreparedStatement` (bug 488663).

C.5.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).

C.5.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

- `PreparedStatement.setCharacterStream()` now implemented
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- Fixed `ResultSet.isAfterLast()` always returning `false`.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.

C.5.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

C.5.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `Byte` to `PreparedStatement.setObject()`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).

- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndex00B`.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.

C.5.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

- Implemented `getBigDecimal()` without scale component for JDBC2.
- Fixed composite key problem with updatable result sets.
- Added detection of `-/+INF` for doubles.
- Faster ASCII string operations.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.

C.5.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- Cleaned up exception handling when driver connects.
- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cesar Garcia and Carlos Martinez.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

C.5.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

C.5.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.

- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

C.5.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

C.5.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they don't.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MySQLIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

C.5.7. Changes in MySQL Connector/J 1.2.x and lower

C.5.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)

- Fixed `getBytes()` for numeric types. (thanks to Ray Bellis)
- Fixed `DatabaseMetaData.getTypeInfo()` for DATE type. (thanks to Paul Johnston)
- Fixed `EscapeProcessor` for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed `EscapeProcessor` to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed `Driver` to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

C.5.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for `PreparedStatement`s
- Fixed null pointer exceptions in `RSMD` and `RS`
- Re-compiled with `jikes` for valid class files (thanks ms!)

C.5.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- `MysqlIO.quit()` now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed `NullPointerException` in `Driver.getPropertyInfo`. (thanks to Dave Potts)
- Fixes to `MysqlDefs` to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed `setDouble` in `PreparedStatement` for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed `getScale()` and `getPrecision()` in `RSMD`. (contrib'd by James Klicman)
- Fixed `getObject()` when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- `DBMD.getTables()` bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

C.5.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The `useUnicode` and `encoding` options are implemented now.
- Fixes to `PreparedStatement` to send binary set by `setXXXStream` to be sent untouched to the MySQL server.
- Fixes to `getDriverPropertyInfo()`.

C.5.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all `ResultSet` fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from `StringBuffer` to String.

- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

C.5.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MySQLIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

C.5.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MySQLIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

C.5.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.

- Fixed `PreparedStatement.toString()` to correctly read data for BLOBS.
- Fixed `PreparedStatement.setDate()` to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (`?user=...` and so forth).

C.5.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the `org.gjt.mm` package directory to use, so now the driver is in the `org.gjt.mm.mysql` package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to `getTypeInfo()` for parameters, and so forth.
- `DatabaseMetaData` is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in `.zip` or `.tar.gz`.

C.5.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that allows `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like `"LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'"`. If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate()`s on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

C.5.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccessException` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

C.5.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

C.5.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.

- Started working on `DatabaseMetaData`.
- The following methods are implemented:
 - `getTables()`
 - `getTableTypes()`
 - `getColumns`
 - `getCatalogs()`

C.6. MySQL Connector/MXJ Change History

C.6.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

- Removed `use-default-architecture` property replaced.
- Moved `platform-map.properties` into `db-files.jar`.
- Updated `build.xml` in preparation for next beta build.
- Clarified the startup max wait numbers.
- Changed tests to shutdown mysqld prior to deleting files.
- Delete `portFile` on shutdown.
- Swapped out commercial binaries for v5.0.40.
- Fixed port file to always be written to datadir.
- Added `os.name-os.arch` to resource directory mapping properties file.

C.6.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Changes in this release:

- Updated `build.xml` in prep for next release.
- Swapped out gpl binaries for v5.0.37.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- `build.xml: usage` now slightly more verbose; some reformatting.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Now incorporates Reggie Burnett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes bug where mysqld was being force terminated. Issue reported by bruno haleblan and others, see:

[MySQL Forums](#).

- In testing so far `mysqld` reliably shuts down cleanly much faster.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Clarified the synchronization of `MysqldResource` methods.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Removed 5.0.22 binaries from the repository.
- Added 5.1.14 binaries to repository.
- Ensured 5.1.14 compatibility.

C.6.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Updated `build.xml` to build to handle with different gpl and commercial `mysld` version numbers.
- Moved `mysqld` binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

C.6.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

- Swapped out the `mysqld` binaries for MySQL v5.0.22.

- Removed "TeeOutputStream" - no longer needed.
- Removed unused imports, formatted code, made minor edits to tests.

C.6.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Changes in this release:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.

Changes made on 11 May 2006:

- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`

Changes made on 11 May 2006:

- Swapped out the mysqld binaries for MySQL v5.0.21

Changes made on 04 May 2006:

- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOption-Map.put("foo", null)`

Changes made on 26 April 2006:

- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)
- moved PID file into `datadir`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (`basedir`, `datadir`)
- insulated users from problems with "." in `basedir`

Changes made on 25 April 2006:

- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- socket is now "mysql.sock" in `datadir`
- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (`basedir`) instead of port.
- altered to be "basedir" rather than "port" oriented.

Changes made on 18 April 2006:

- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`

Changes made on 16 March 2006:

- swapped out the mysqld binaries for MySQL v5.0.19
- added ability to specify "mysql-version" as an url parameter
- extracted splitLines(String) to Str utility class
- extracted array and list printing to ListToString utility class
- reformatted code

Changes made on 16 January 2006:

- swapped out the mysqld binaries for MySQL v5.0.18
- "platform" directories replace spaces with underscores
- help parsing test reflects current help options

C.6.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

C.6.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Changes made on 16 January 2006:

- Swapped out the mysqld binaries for MySQL v5.0.16.

Changes made on 25 October 2005:

- Altered examples and tests to use new Connector/J 5.0 URL syntax for for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Minor refactorings for type casting and exception handling.

Changes made on 30 August 2005:

- Reorganized utils into a single "Utils" collaborator.
- Ditched "ClassUtil" (merged with Str).
- Removed HelpOptionsParser's need to reference a MysqldResource.

Changes made on 29 August 2005:

- Minor test tweaks

C.7. MySQL Proxy Change History

C.7.1. Changes in MySQL MySQL Proxy 0.6.0 (Not yet released)

Functionality added or changed:

- Added `--no-daemon` and `--pid-file`.
 - Added `--no-proxy` to disable the proxy.
 - Added testcases.
 - Added support for `proxy.response.packets`.
 - Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
 - Added support in `read_query_result()` to overwrite the result-set.
 - Added connection pooling.
 - Added a global lua-scope `proxy.global.*`.
 - Added support for listening UNIX sockets.
 - Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
-
- Fixed decoding of len-encoded ints for 3-byte notation.
 - Fixed check for `glib2` to require at least 2.6.0.
 - Fixed mem-leak with `proxy.response.*` is used.
 - Fixed handling of (SQL) `NULL` in result-sets.
 - Fixed `inj.resultset.affected_rows` on `SELECT` queries.
 - Fixed len-encoding on `proxy.resultsets`.
 - Fixed assertion when all backends are down and we try to connect.
 - Fixed assertion when connecting to the MySQL 6.0.1.
 - Fixed crash if `proxy.connection` is used in `connect_server()`.
 - Fixed connection-stalling if `read_query_result()` throws an `assert()`ion.
 - Fixed assertion at `COM_SHUTDOWN`. (Bug#29719)
 - Fixed assertion at login with empty password + empty default db. (Bug#29719)
 - Fixed assertion on result-packets like `[ field-len | fields | EOF | ERR ]`. (Bug#29732)
 - Fixed compilation on win32.
 - Fixed assertion on `COM_BINLOG_DUMP`. (Bug#29764)

C.7.2. Changes in MySQL MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added script examples for rewriting and injection.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.

- Added support for pre-4.1 passwords in a 4.1 connection.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added `resultset.affected_rows` and `resultset.insert_id`.
- Added `proxy.VERSION`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.

Bugs fixed:

- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.
- Fixed warning if `connect_server()` is not provided.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed mysql check in configure to die when `mysql.h` isn't detected.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed assertion when a error occurs at initial script exec time.

C.7.3. Changes in MySQL MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Features in this release:

- Added `automake/autoconf` support.
- Added `cmake` support.

Appendix D. Limits and Restrictions

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

D.1. Restrictions on Stored Routines and Triggers

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of restrictions apply only to stored functions, and not to stored procedures.

All of the restrictions for stored functions also apply to triggers.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES`, `UNLOCK TABLES`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`). Implication: You cannot use dynamic SQL within stored functions or triggers (where you construct dynamically statements as strings and then execute them).

In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.7, “SQL Syntax for Prepared Statements”](#), for a list of statements supported in prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in [Chapter 19, *Stored Procedures and Functions*](#).

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that do explicit or implicit commit or rollback.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and `SHOW` statements. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 19.2.7.3, “SELECT ... INTO Statement”](#).
- `FLUSH` statements.
- Recursive statements. That is, stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- `ALTER VIEW`.

Note that although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, although you can use `FLUSH` in a stored procedure, such a stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that table columns do not take precedence over variables is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 19.4, “Binary Logging of Stored Routines and Triggers”](#).

`INFORMATION_SCHEMA` does not yet have a `PARAMETERS` table, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements.

There are no stored routine debugging facilities.

Before MySQL 5.1.4, `CALL` statements cannot be prepared. This true both for server-side prepared statements and for SQL prepared statements.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

The `RENAME DATABASE` statement does not migrate stored routines to the new schema name. See [Section 12.1.18, “RENAME DATABASE Syntax”](#).

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

Stored routines and triggers in MySQL Cluster. Stored functions, stored procedures, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is very likely to produce undesirable results, and is not supported by MySQL AB.*

D.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a **MEMORY** table, but is converted to a **MyISAM** table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read-only; you cannot use a cursor to update rows.

UPDATE WHERE CURRENT OF and **DELETE WHERE CURRENT OF** are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as **CHECK TABLES**, **HANDLER READ**, and **SHOW BINLOG EVENTS**.

D.3. Restrictions on Subqueries

- In MySQL 5.1 before 5.1.16, if you compare a **NULL** value to a subquery using **ALL**, **ANY**, or **SOME**, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of **NULL** rather than to **TRUE** or **FALSE**.
- A subquery's outer statement can be any one of: **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **SET**, or **DO**.
- Subquery optimization for **IN** is not as effective as for the **=** operator or for **IN(value_list)** constructs.

A typical case for poor **IN** subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an **IN** subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return *M* and *N* rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an **IN** subquery can be much slower than a query written using an **IN(value_list)** construct that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);  
UPDATE t ... WHERE col = (SELECT ... FROM t ...);  
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the **FROM** clause. Ex-

ample:

```
UPDATE t ... WHERE col = (SELECT (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the **FROM** clause is stored as a temporary table, so the relevant rows in **t** have already been selected by the time the update to **t** takes place.

- Row comparison operations are only partially supported:
 - For **expr IN (subquery)**, **expr** can be an *n*-tuple (specified via row constructor syntax) and the subquery can return rows of *n*-tuples.
 - For **expr op {ALL|ANY|SOME} (subquery)**, **expr** must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for **IN** but not for the others is that **IN** is implemented by rewriting it as a sequence of **=** comparisons and **AND** operations. This approach cannot be used for **ALL**, **ANY**, or **SOME**.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the **FROM** clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an **IN** subquery can be rewritten as a **SELECT DISTINCT** join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra **DISTINCT** operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans **outer_table** first and then executes the subquery on **inner_table** for each row. If **outer_table** has a lot of rows and **inner_table** has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on (`ot.a`, `ot.b`).

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
           AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

D.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view. This limitation will be lifted in the future.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section D.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
```

```
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition (which invalidates the view) and no warning results from the drop or alter operation. An error occurs later when the view is used.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view contents seen each time the statement is executed later will be the contents of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT 1;
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT 2;
EXECUTE s;
```

The result returned by the `EXECUTE` statement is 1, not 2.

- If a statement in a stored routine refers to a view, the view contents seen by the statement are its contents the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view contents, even if the view definition is changed later in the loop. Example:

```
CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ()
BEGIN
  DECLARE i INT DEFAULT 0;
  WHILE i < 5 DO
    SELECT * FROM v;
    SET i = i + 1;
    ALTER VIEW v AS SELECT 2;
  END WHILE;
END;
//
delimiter ;
CALL p();
```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

D.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

The MySQL XA implementation is for “external XA,” where a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. “Internal XA” is not implemented. This would allow individual storage engines within a MySQL server to act as RMs, and the server itself to act as a TM. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA is incomplete because it requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

D.6. Limits in MySQL

This section lists current limits in MySQL 5.1.

D.6.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

Appendix E. Credits

This appendix lists the developers, contributors, and supporters that have helped to make MySQL what it is today.

E.1. Developers at MySQL AB

These are the developers that are or have been employed by MySQL AB to work on the [MySQL](#) database software, roughly in the order they started to work with us. Following each developer is a small list of the tasks that the developer is responsible for, or the accomplishments they have made. All developers are involved in support.

- Michael (Monty) Widenius
 - Lead developer and main author of the MySQL server ([mysqld](#)).
 - New functions for the string library.
 - Most of the [mysys](#) library.
 - The [ISAM](#) and [MyISAM](#) libraries (B-tree index file handlers with index compression and different record formats).
 - The [HEAP](#) library. A memory table system with our superior full dynamic hashing. In use since 1981 and published around 1984.
 - The [replace](#) program (take a look at it, it's **COOL!**).
 - Connector/ODBC (MyODBC), the ODBC driver for Windows.
 - Fixing bugs in MIT-pthreads to get it to work for MySQL Server. And also Unireg, a curses-based application tool with many utilities.
 - Porting of [mSQL](#) tools like [msqlperl](#), [DBD/DBI](#), and [DB2mysql](#).
 - Most of [crash-me](#) and the foundation for the MySQL benchmarks.
- David Axmark
 - Initial main writer of the **Reference Manual**, including enhancements to [texi2html](#).
 - Automatic Web site updating from the manual.
 - Initial Autoconf, Automake, and Libtool support.
 - Licensing.
 - Parts of all the text files. (Nowadays only the [README](#) is left. The rest ended up in the manual.)
 - Lots of testing of new features.
 - Our in-house Free Software legal expert.
 - Mailing list maintainer (who never has the time to do it right...).
 - Our original portability code (now more than 10 years old). Nowadays only some parts of [mysys](#) are left.
 - Someone for Monty to call in the middle of the night when he just got that new feature to work.
 - Chief "Open Sourcerer" (MySQL community relations).
- Jani Tolonen
 - [mysqlimport](#)
 - A lot of extensions to the command-line clients.

- `PROCEDURE ANALYSE( )`
- Sinisa Milivojevic (now in support)
 - Compression (with `zlib`) in the client/server protocol.
 - Perfect hashing for the lexical analyzer phase.
 - Multi-row `INSERT`
 - `mysqldump -e` option
 - `LOAD DATA LOCAL INFILE`
 - `SQL_CALC_FOUND_ROWS SELECT` option
 - `--max-user-connections=...` option
 - `net_read` and `net_write_timeout`
 - `GRANT/REVOKE` and `SHOW GRANTS FOR`
 - New client/server protocol for 4.0
 - `UNION` in 4.0
 - Multiple-table `DELETE/UPDATE`
 - Subqueries in the `FROM` clause (4.1).
 - User resources management
 - Initial developer of the `MySQL++` C++ API and the `MySQLGUI` client.
- Tonu Samuel (past developer)
 - VIO interface (the foundation for the encrypted client/server protocol).
 - MySQL Filesystem (a way to use MySQL databases as files and directories).
 - The `CASE` expression.
 - The `MD5( )` and `COALESCE( )` functions.
 - `RAID` support for `MyISAM` tables.
- Sasha Pachev (past developer)
 - Initial implementation of replication (up to version 4.0).
 - `SHOW CREATE TABLE`.
 - `mysql-bench`
- Matt Wagner
 - MySQL test suite.
 - Webmaster (until 2002).
- Miguel Solorzano (now in support)
 - Win32 development and release builds.
 - Windows NT server code.

- WinMySQLAdmin
- Timothy Smith (now in development)
 - Dynamic character sets support.
 - configure, RPMs and other parts of the build system.
 - Initial developer of [libmysqld](#), the embedded server.
- Sergei Golubchik
 - Full-text search.
 - Added keys to the [MERGE](#) library.
 - Precision math.
- Jeremy Cole (past developer)
 - Proofreading and editing this fine manual.
 - [ALTER TABLE ... ORDER BY](#)
 - [UPDATE ... ORDER BY](#)
 - [DELETE ... ORDER BY](#)
- Indrek Siitan
 - Designing/programming of our Web interface.
 - Author of our newsletter management system.
- Jorge del Conde (past developer)
 - [MySQLCC \(MySQL Control Center\)](#)
 - Win32 development
 - Initial implementation of the Web site portals.
- Venu Anuganti (past developer)
 - MyODBC 3.51
 - New client/server protocol for 4.1 (for prepared statements).
- Arjen Lentz (also handled community, 2004-2006; now works in Support)
 - Maintainer of the MySQL Reference Manual (2001-2004).
 - Preparing the O'Reilly printed edition of the manual (2002).
- Alexander (Bar) Barkov, Alexey (Holyfoot) Botchkov, and Ramil Kalimullin
 - Spatial data (GIS) and R-Trees implementation for 4.1
 - Unicode and character sets for 4.1; documentation for same
- Oleksandr (Sanja) Byelkin
 - Query cache in 4.0
 - Implementation of subqueries (4.1).

- Implementation of views (5.0).
- Aleksey (Walrus) Kishkin and Alexey (Ranger) Stroganov
 - Benchmarks design and analysis.
 - Maintenance of the MySQL test suite.
- Zak Greant (past employee)
 - Open Source advocate, MySQL community relations.
- Carsten Pedersen
 - The MySQL Certification program.
- Lenz Grimmer
 - Production (build and release) engineering.
- Peter Zaitsev
 - [SHA1\(\)](#), [AES_ENCRYPT\(\)](#) and [AES_DECRYPT\(\)](#) functions.
 - Debugging, cleaning up various features.
- Alexander (Salle) Keremidarski
 - Support.
 - Debugging.
- Per-Erik Martin
 - Lead developer for stored procedures (5.0).
- Jim Winstead
 - Former lead Web developer.
 - Improving server, fixing bugs.
- Mark Matthews
 - Connector/J driver (Java).
- Peter Gultzan
 - SQL standards compliance.
 - Documentation of existing MySQL code/algorithms.
 - Character set documentation.
- Guilhem Bichot
 - Replication, from [MySQL](#) version 4.0.
 - Fixed handling of exponents for [DECIMAL](#).
 - Author of [mysql_tableinfo](#).
 - Backup (in 5.1).
- Antony T. Curtis

- Porting of the MySQL Database software to OS/2.
- Mikael Ronstrom
 - Much of the initial work on NDB Cluster until 2000. Roughly half the code base at that time. Transaction protocol, node recovery, system restart and restart code and parts of the API functionality.
 - Lead Architect, developer, debugger of NDB Cluster 1994-2004
 - Lots of optimizations
- Jonas Orelund
 - On-line Backup
 - The automatic test environment of MySQL Cluster
 - Portability Library for NDB Cluster
 - Lots of other things
- Pekka Nouisiainen
 - Ordered index implementation of MySQL Cluster
 - BLOB support in MySQL Cluster
 - Charset support in MySQL Cluster
- Martin Skold
 - Unique index implementation of MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Magnus Svensson
 - The test framework for MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Tomas Ulin
 - Lots of work on configuration changes for simple installation and use of MySQL Cluster
- Konstantin Osipov
 - Prepared statements.
 - Cursors.
- Dmitri Lenev
 - Time zone support.
 - Triggers (in 5.0).

E.2. Contributors to MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize those who have made contributions of one kind or another to the [MySQL distribution](#). Contributors are listed here, in somewhat random order:

- Gianmassimo Vigazzola <qwerg@mbox.vol.it> or <qwerg@tin.it>

The initial port to Win32/NT.

- Per Eric Olsson

For more or less constructive criticism and real testing of the dynamic record format.

- Irena Pancirov <irena@mail.yacc.it>

Win32 port with Borland compiler. [mysqlshutdown.exe](#) and [mysqlwatch.exe](#)

- David J. Hughes

For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with [mSQL](#), but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. [mysqladmin](#) and [mysql client](#) are programs that were largely influenced by their [mSQL](#) counterparts. We have put a lot of effort into making the MySQL syntax a superset of [mSQL](#). Many of the API's ideas are borrowed from [mSQL](#) to make it easy to port free [mSQL](#) programs to the MySQL API. The MySQL software doesn't contain any code from [mSQL](#). Two files in the distribution ([client/inser_t_test.c](#) and [client/select_test.c](#)) are based on the corresponding (non-copyrighted) files in the [mSQL](#) distribution, but are modified as examples showing the changes necessary to convert code from [mSQL](#) to MySQL Server. ([mSQL](#) is copyrighted David J. Hughes.)

- Patrick Lynch

For helping us acquire <http://www.mysql.com/>.

- Fred Lindberg

For setting up gmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

- Igor Romanenko <igor@frog.kiev.ua>

[mysqldump](#) (previously [msqldump](#), but ported and enhanced by Monty).

- Yuri Dario

For keeping up and extending the MySQL OS/2 port.

- Tim Bunce

Author of [mysqlhotcopy](#).

- Zarko Mocnik <zarko.mocnik@dem.si>

Sorting for Slovenian language.

- "TAMITO" <tommy@valley.ne.jp>

The [_MB](#) character set macros and the [ujis](#) and [sjis](#) character sets.

- Joshua Chamas <joshua@chamas.com>

Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.

- Yves Carlier <Yves.Carlier@rug.ac.be>

[mysqlaccess](#), a program to show the access rights for a user.

- Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)

For one of the early JDBC drivers.

- Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>

Further development of one of the early JDBC drivers and other MySQL-related Java tools.

- James Cooper <pixel@organic.com>

For setting up a searchable mailing list archive at his site.

- Rick Mehalick <Rick_Mehalick@i-o.com>

For [xmysql](#), a graphical X client for MySQL Server.

- Doug Sisk <sisk@wix.com>

For providing RPM packages of MySQL for Red Hat Linux.

- Diemand Alexander V. <axeld@vial.ethz.ch>

For providing RPM packages of MySQL for Red Hat Linux-Alpha.

- Antoni Pamies Olive <toni@readysoft.es>

For providing RPM versions of a lot of MySQL clients for Intel and SPARC.

- Jay Bloodworth <jay@pathways.sde.state.sc.us>

For providing RPM versions for MySQL 3.21.

- David Sacerdote <davids@secnet.com>

Ideas for secure checking of DNS hostnames.

- Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>

Some support for Chinese(BIG5) characters.

- Wei He <hewei@mail.ied.ac.cn>

A lot of functionality for the Chinese(GBK) character set.

- Jan Pazdziora <adelton@fi.muni.cz>

Czech sorting order.

- Zeev Suraski <bourbon@netvision.net.il>

[FROM_UNIXTIME\(\)](#) time formatting, [ENCRYPT\(\)](#) functions, and [bison](#) advisor. Active mailing list member.

- Luuk de Boer <luuk@wxs.nl>

Ported (and extended) the benchmark suite to [DBI/DBD](#). Have been of great help with [crash-me](#) and running benchmarks. Some new date functions. The [mysql_setpermission](#) script.

- Alexis Mikhailov <root@medinf.chuvashia.su>

User-defined functions (UDFs); [CREATE FUNCTION](#) and [DROP FUNCTION](#).

- Andreas F. Bobak <bobak@relog.ch>

The [AGGREGATE](#) extension to user-defined functions.

- Ross Wakelin <R.Wakelin@march.co.uk>

Help to set up InstallShield for MySQL-Win32.

- Jethro Wright III <jetman@li.net>

The [libmysql.dll](#) library.

- James Pereria <jpereira@iafrica.com>

Mysqlmanager, a Win32 GUI tool for administering MySQL Servers.

- Curt Sampson <cjs@portal.ca>
Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.
- Martin Ramsch <m.ramsch@computer.org>
Examples in the MySQL Tutorial.
- Steve Harvey
For making [mysqlaccess](#) more secure.
- Konark IA-64 Centre of Persistent Systems Private Limited
<http://www.pspl.co.in/konark/>. Help with the Win64 port of the MySQL server.
- Albert Chin-A-Young.
Configure updates for Tru64, large file support and better TCP wrappers support.
- John Birrell
Emulation of [pthread_mutex\(\)](#) for OS/2.
- Benjamin Pflugmann
Extended [MERGE](#) tables to handle [INSERTS](#). Active member on the MySQL mailing lists.
- Jocelyn Fournier
Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).
- Marc Liyanage
Maintaining the Mac OS X packages and providing invaluable feedback on how to create Mac OS X PKGs.
- Robert Rutherford
Providing invaluable information and feedback about the QNX port.
- Previous developers of NDB Cluster
Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <jehamby@lightside>, <psmith@BayNetworks.com>, <duane@connect.com.au>, Ted Deppner <ted@psyber.com>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch <dkoch@amcity.com>
Irix setup.
- Luuk de Boer <luuk@wxs.nl>
Benchmark questions.
- Tim Sailer <tps@users.buoy.com>

[DBD::mysql](#) questions.

- Boyd Lynn Gerber <gerberb@zenez.com>

SCO-related questions.

- Richard Mehalick <RM186061@shellus.com>

[xmysql](#)-related questions and basic installation questions.

- Zeev Suraski <bourbon@netvision.net.il>

Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.

- Francesc Guasch <frankie@citel.upc.es>

General questions.

- Jonathan J Smith <jsmith@wtp.net>

Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.

- David Sklar <sklar@student.net>

Using MySQL from PHP and Perl.

- Alistair MacDonald <A.MacDonald@uel.ac.uk>

Is flexible and can handle Linux and perhaps HP-UX. Tries to get users to use [mysqlbug](#).

- John Lyon <jlyon@imag.net>

Questions about installing MySQL on Linux systems, using either [.rpm](#) files or compiling from source.

- Lorvid Ltd. <lorvid@WOLFENET.com>

Simple billing/license/support/copyright issues.

- Patrick Sherrill <patrick@coconet.com>

ODBC and VisualC++ interface questions.

- Randy Harmon <rjharmon@uptimecomputers.com>

[DBD](#), Linux, some SQL syntax questions.

E.3. Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the documentation or error messages in MySQL.

- Paul DuBois

Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.

- Kim Aldale

Helped to rewrite Monty's and David's early attempts at English into English.

- Michael J. Miller Jr. <mke@terrapin.turbolift.com>

For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

- Yan Cailin

First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded (<http://mysql.hitstar.com/>) versions were based. [Personal home page at linuxdb.yeah.net](#).

- Jay Flaherty <fty@mediapulse.com>

Big parts of the Perl [DBI/DBD](#) section in the manual.

- Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>

Proof-reading of the Reference Manual.

- Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scalaire.fr>

French error messages.

- Petr Snajdr, <snajdr@pvt.net>

Czech error messages.

- Jaroslaw Lewandowski <jotel@itnet.com.pl>

Polish error messages.

- Miguel Angel Fernandez Roiz

Spanish error messages.

- Roy-Magne Mo <rmo@www.hivolda.no>

Norwegian error messages and testing of MySQL 3.21.xx.

- Timur I. Bakeyev <root@timur.tatarstan.ru>

Russian error messages.

- <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>

Italian error messages.

- Dirk Munzinger <dirk@trinity.saar.de>

German error messages.

- Billik Stefan <billik@sun.uniag.sk>

Slovak error messages.

- Stefan Saroiu <tzoompy@cs.washington.edu>

Romanian error messages.

- Peter Feher

Hungarian error messages.

- Roberto M. Serqueira

Portuguese error messages.

- Carsten H. Pedersen

Danish error messages.

- Arjen Lentz

Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

E.4. Libraries used by and included with MySQL

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are very thankful to all individuals that have created these and it has made our life much easier.

- Fred Fish

For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

- Richard A. O'Keefe

For his public domain string library.

- Henry Spencer

For his regex library, used in `WHERE column REGEXP regexp`.

- Chris Provenzano

Portable user level pthreads. From the copyright: This product includes software developed by Chris Provenzano, the University of California, Berkeley, and contributors. We are currently using version 1_60_beta6 patched by Monty (see [mit-pthreads/Changes-mysql](#)).

- Jean-loup Gailly and Mark Adler

For the zlib library (used on MySQL on Windows).

- Bjorn Benson

For his safe_malloc (memory checker) package which is used in when you configure MySQL with `--debug`.

- Free Software Foundation

The [readline](#) library (used by the `mysql` command-line client).

- The NetBSD foundation

The [libedit](#) package (optionally used by the `mysql` command-line client).

E.5. Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We can't list every possible package here because the list would then be way too hard to maintain. For other packages, please refer to the software portal at <http://solutions.mysql.com/software/>.

- Tim Bunce, Alligator Descartes

For the [DBD](#) (Perl) interface.

- Andreas Koenig <a.koenig@mind.de>

For the Perl interface for MySQL Server.

- Jochen Wiedmann <wiedmann@neckar-alb.de>

For maintaining the Perl `DBD::mysql` module.

- Eugene Chan <eugene@acenet.com.sg>

For porting PHP for MySQL Server.

- Georg Richter

MySQL 4.1 testing and bug hunting. New PHP 5.0 `mysqli` extension (API) for use with MySQL 4.1 and up.

- Giovanni Maruzzelli <maruzz@matrice.it>

For porting iODBC (Unix ODBC).

- Xavier Leroy <Xavier.Leroy@inria.fr>

The author of LinuxThreads (used by the MySQL Server on Linux).

E.6. Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation

From whom we got an excellent compiler (`gcc`), an excellent debugger (`gdb`) and the `libc` library (from which we have borrowed `strto.c` to get some code working in Linux).

- Free Software Foundation & The XEmacs development team

For a really great editor/environment used by almost everybody at MySQL AB.

- Julian Seward

Author of `valgrind`, an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

- Dorothea Lütkehaus and Andreas Zeller

For `DDD` (The Data Display Debugger) which is an excellent graphical front end to `gdb`.

E.7. Supporters of MySQL

Although MySQL AB owns all copyrights in the `MySQL server` and the `MySQL manual`, we wish to recognize the following companies, which helped us finance the development of the `MySQL server`, such as by paying us for developing a new feature or giving us hardware for development of the `MySQL server`.

- VA Linux / Andover.net

Funded replication.

- NuSphere

Editing of the MySQL manual.

- Stork Design studio

The MySQL Web site in use between 1998-2000.

- Intel

Contributed to development on Windows and Linux platforms.

- Compaq

Contributed to Development on Linux/Alpha.

- SWSoft

Development on the embedded `mysqld` version.

- FutureQuest

`--skip-show-database`
